## HEMATOLOGY

### HbA1c

Investigation	Result	Normal Value
Glycosylated Hb	5.8 %	> 8 : Action Suggested 7-8 : Good Control < 7 : Goal 6-7 : Near Normal Glycemia < 6 : Non-diabetic Level
Estimated Average Glucose	119.76	

### Explanation :

Total haemoglobin A1c is continuously synthesized in the red blood cell through its 120 days life span. The concentration of HbA1c in the cell reflects the average blood glucose concentration it encounters. The level of HbA1c increases proportionately in patients with uncontrolled diabetes. It reflects the average blood glucose concentration over an extended period and remains unaffected by short-term fluctuations in blood glucose levels. The measurement of HbA1c can serve as a convenient test for evaluating the adequacy of diabetic control and in preventing various diabetic complications. Because the average half life of a red blood cells is sixty days, HbA1c has been accepted as a measurement which reflects the mean daily blood glucose concentration, better than fasting blood glucose determination, and the degree of carbohydrate imbalance over the preceding two months. It may also provide a better index of control of the diabetic patient without resorting to glucose loading procedures.

**HbA1c ASSAY Interferences :**  
Erroneous values might be obtained from samples with abnormally elevated quantities of other Haemoglobins as a result of either their simultaneous elution with HbA1c (HbF) or differences in their glycation from that of HbA (HbS).
