INTERPRETATION

- 1) Human hemoglobin inside erythrocytes undergoes a non enzymatic chemical reaction with glucose. The rate & extent of this reaction are thought to be dependent on the average blood glucose.
- 2) The ratio of HbA1c to the total HbA concentration has been suggested as a reliable measure of the degree of metabolic control in diabetic patients.
- 3) Lipemic and icteric samples do not interfere with the measurement of the percent HbA1c.
- 4) Hemoglobin F (Hb F) has the potential to interfere with the measurement of HbA1c generating falsely elevated % A1c values average blood glucose.

N.B.: All reference ranges are age and sex matched. Reference limits mentioned herein are in accordance with the literature along with the kit whi may change with the change in chemistry or the kit.

N.B.: 1. The above result relates only to the items tested and only to the time of testing. 2. The above report cannot be reproduced in part or whole without the written permission of the chief pathologist.

PROSTATE SPECIFIC ANTIGEN (PSA)

PROSTATE SPECIFIC ANTIGEN (PSA) 2.59 ng/ml <3.5

Information : Prostate-specific antigen (PSA) is a glycoprotein that is produced by the prostate gland, the lining of the urethra, and the bulbourethral gland. PSA exists in serum mainly in two forms, complexed to alpha-1 -ant -chymotrypsin (PSA-ACT complex) and unbound (free PSA). Increases in prostate glandular size and tissue damage caused by benign prostatic hypertrophy, prostatitis, or prostate cancer may increase circulating PSA levels. Transient increase in PSA can also be seen following per rectal digital or urological examinations

Interpretation:

- For diagnostic purposes, the next step should be to measure thyroxine and the pituitary gland before, without medications and other drugs.
- The assay is interfered by iodine (plasma < 200 µg/dl or < 40 µg/L), perchlorate (plasma < 0.20 µmol/L or < 1 µg/L), dopamine (plasma < 1000 ng/dl), biotin (plasma) < 20 µg/ml, IgG < 2 g/L and IgM < 0.5 g/dl).
- There is no high dose hook effect at TSH concentrations up to 1000 uIU/ml.
- TSH values may be transiently elevated because of non-specific cross reactivity (steroids, benzodiazepines and heart failure, severe burns, trauma and surgery etc). Drugs that decrease TSH values: g. Lithium, Glucocorticoid drugs that decrease TSH values: g. Iodine, Estrogens, Amiodarone.
- The assay is interfered by iodine (plasma) < 200 µg/dl or < 40 µg/L, perchlorate (plasma) < 0.20 µmol/L, biotin (plasma) < 20.0 µg/ml or < 200 µg/dl and biotin < 405 ng/ml or < 100 µg/ml).
