INTERPRETATION:

- The principal clinical use for hTSH measurement is for the assessment of thyroid status.
- In patients with intact hypothalamic-pituitary function, hTSH is measured to:
 - exclude hypothyroidism (elevated levels of hTSH) or hyperthyroidism (depressed or nondetectable levels of hTSH);
 - monitor T4 replacement treatment in primary hypothyroidism or antithyroid treatment in hyperthyroidism;
 - follow T4 suppression of the trophic influence of hTSH in "cold nodules" and non-toxic goiter; and
 - assess the response to TRH stimulation testing.
- As more sensitive and precise methods become available, hTSH measurements are also increasingly used to identify subclinical or latent hypothyroidism or hyperthyroidism.

PROSTATE SPECIFIC ANTIGEN

*Chemiluminescence immunoassay (CLIA)***Clinical Use:**

1. An aid in the early detection of Prostate cancer when used in conjunction with Digital rectal examination in males more than 50 years of age and in those with two or more affected first degree relatives.
2. Followup and management of Prostate cancer patients.
3. Detect metastatic or persistent disease in patients following surgical or medical treatment of Prostate cancer.

Note:

1. PSA levels may appear consistently elevated / depressed due to the interference by heterophilic antibodies & nonspecific protein binding.
2. Immediate PSA testing following digital rectal examination, ejaculation, prostatic massage, indwelling catheterization, ultrasonography and needle biopsy of prostate is not recommended as they falsely elevate levels.
3. Sites of Non-prostatic PSA production are breast epithelium, salivary glands, periurethral & anal glands, cells of male urethra & breast milk.
4. Physiological decrease in PSA level by 18% has been observed in hospitalized / sedentary patients either due to supine position or suspended sexual activity.

Recommended Testing Intervals:

- Pre-operatively (Baseline)
- 2-4 days post-operatively
- Prior to discharge from hospital
- Monthly followup if levels are high or show a rising trend

TSH levels are subject to circadian variation, reaching peak levels between 2 - 4.a.m. and at a minimum between 6-10 pm . The variation is of the order of 50% .hence

time of the day has influence on the measured serum TSH concentrations.

TSH levels During Pregnancy :

First Trimester :0.1 to 2.5 μ U/mL Second Trimester : 0.2 to 3.0 μ U/mL Third trimester : 0.3 to 3.0 μ U/mL
