Comments:

• Disorders of Lipid metabolism play a major role in atherosclerosis and coronary heart disease.

• There is an established relationship between increased total cholesterol & LDL cholesterol and myocardial infarction.

HDL cholesterol level is inversely related to the incidence of coronary artery disease.
Major risk factors which adversely affect the lipid levels are:

- - 1. Cigarette smoking.
  - 2. Hypertension.
  - 3. Family history of premature coronary heart disease.
  - 4. Pre-existing coronary heart disease.

>8% Action suggested due to high risk of developing long term complications like Retinopa Nephropathy, Cardiopathy and Neuropathy							
7.1 - 8.0	Fair Control						
<7.0	Good Control						

Note:

1.A three monthly monitoring is recommended in diabetics.

2. Since HbA1c concentration represents the integrated values for blood glucose over the preceding 6 - 10 weeks and is not affected by daily glucose fluctuation, exercise and recent food intake, it is a more useful tool for monitoring diabetics.
