HbA1c (Whole Blood)

Test	Result	Unit	Reference Range
HbA1C-Glycosylated Haemoglobin	: 6.30	%	Non-diabetic: 4-6 Excellent Control: 6-7 Fair to good control: 7-8 Unsatisfactory control: 8-10 Poor Control: >10

EDTA Whole Blood, Method: HPLC

Estimated Average Glucose (eAG)	: 134.11	mg/dl	65.1-136.3 mg/dL mg/dl
---------------------------------	----------	-------	------------------------

EDTA Whole Blood, Method: Calculated

Interpretation:

- 1.The term HbA1c refers to Glycated Haemoglobin. Measuring HbA1c gives an overall picture of what the average blood sugar levels have been over a period of weeks/month. Higher the HbA1c, the greater the risk of developing diabetes-related complications.
- 2.HbA1c has been endorsed by clinical groups and ADA (American Diabetes Association) guidelines 2012, for the diagnosis of diabetes using a cut-off point of 6.5%. ADA defined biological reference range for HbA1c is between 4-6%. Patients with HbA1c value between 6.0-6.5% are considered at risk for developing diabetes in the future. Trends in HbA1c area a better indicator of glucose control than standalone test.
- 3.To estimate the eAG from the HbA1c value, the following equation is used: eAG(mg/dl) =28.7*A1c-46.7.
- 4.Diabetic must aspire to keep values under 7% to avoid the various complications resulting from diabetes.

Interpretation

1. Triglycerides: When triglycerides are very high greater than 1000 mg/dL, there is a risk of developing pancreatitis in children and adults. Triglycerides change dramatically in response to meals, increasing as much as 5 to 10 times higher than fasting levels just a few hours after eating. Even fasting levels vary considerably day to day. Therefore, modest changes in fasting triglycerides measured on different days are not considered to be abnormal.
2. HDL-Cholesterol: HDL- C is considered to be beneficial, the so-called "good" cholesterol, because it removes excess cholesterol from tissues and carries it to the liver for disposal.
3. LDL-Cholesterol: Desired goals for LDL-C levels change based on individual risk factors.

THYROID FUNCTION TEST

Test	Result	Unit	Biological Ref. Range
Total T3	: 1.1	ng/dl	0.70-2.04 ng/dl
<i>Serum, Method: CLIA</i>			
Total T4	: 8.60	µg/dl	5.1-14.1 µg/dl
<i>Serum, Method: CLIA</i>			
TSH (Thyroid Stimulating Hormone)	: 11.47	µIU/ml	0.27-5.3 µIU/ml
<i>Serum, Method: CLIA</i>			

Interpretation Decreased TSH with raised or within range T3 and T4 is seen in primary hyperthyroidism, toxic thyroid nodule, sub-clinical hyperthyroidism, on thyroxine ingestion, post-partum and gestational thyrotoxicosis Raised TSH with decreased T3 and T4 is seen in hypothyroidism and with intermittent T4 therapy. Alterations in TSH are also seen in non-thyroidal illnesses like HIV infection, chronic active hepatitis ,estrogen producing tumors, pregnancy, new-born, steroids, glucocorticoids and may cause false thyroid levels for thyroid function tests as with increased age ,marked variations in thyroid hormones are seen. In pregnancy T3 and T4 levels are raised, hence FT3 and Ft4 is to be done to determine hyper or hypothyroidism.
