1-2 Days	3.2-3.43 uIU/ml
3-4 Days	0.7-15.4 uIU/ml
15 Days-5 Months	1.7-9.1 uIU/ml
5 Months-2 Years	0.7-6.4 uIU/ml
2 Years-12 Years	0.64-6.27 uIU/ml
12 Years-18 Years	0.51-4.94 uIU/ml
>18 Years	0.35-5.50 uIU/ml

Adults

Note: TSH levels are subject to circadian variation, rising several hours before the onset of sleep, reaching peak levels between 11 pm to 6 am. Nadir concentrations are observed during the afternoon. Diurnal variation in TSH level approximates + 50 %, hence time of the day has influence on the measured serum TSH concentration. Although elevated TSH levels are nearly always indicative of primary hypothyroidism, and may be seen in secondary thyrotoxicosis.

Newborn

In a very low birth weight baby (particularly premature neonates) immaturity of the hypothalamic-pituitary-thyroid axis may mask primary congenital hypothyroidism. It is recommended that the test be repeated two weeks after birth in babies 1000-1500 gm and at four weeks in those <1000 gm. Specimen collection prior to 24 hours of age, after blood transfusion and prematurity can affect this screening.

Nearly 90% of CH cases are detected by newborn screening. A small number of children may test normal on the newborn screen but later develop hypothyroidism.

TotalPSA,SerumPlain 0.38 ng/ml 0.00- 4.00

Increased Value is seen in Benign Prostatic Hypertrophy (BPH), Prostatitis, or Prostate Cancer.

When total PSA concentration is < 2.0 ng/ml, the probability of prostate cancer in asymptomatic men is low.

When total PSA concentration is > 10.0 ng/mL, the probability of cancer is high and prostate biopsy is generally recommended.

The Total PSA range of 4.0 to 10.0 ng/ml has been described as a diagnostic "gray zone," in which the Free: Total PSA ratio helps to determine the relative risk of prostate cancer.

Therefore, some urologists recommend using the Free: Total ratio to help select which men should undergo biopsy.

However, even a negative result of prostate biopsy does not rule-

out prostate cancer. Up to 20% of men with negative biopsy results have subsequently been found to have cancer.

High total PSA levels and lower percentages of free PSA are associated with high risk of prostate cancer. Based on free: total

PSA ratio: the percent probability of finding prostate cancer on a needle biopsy by age in years:

Free PSA as a percent of Total PSA	Probability of carcinoma prostate when Total PSA is 4.1-10.0 ng/ml
>=	268%
20-25	16%
15-20	20%
10-15	28%
0-10	56%
