Special Test				
URINE COTININE*				
Urine Cotinine <i>Method : Immunochromatography</i>	NEGATIVE		Negative	

Interpretation:

This is a one step, competitive immunochromatographic assay for the qualitative detection of cotinine in the human urine. Cotinine is a major metabolite of nicotine and it can be detected in physiological body fluids like blood, saliva and urine. It is stable in body fluids and has a relatively long half life of 17 hours and its concentration within an individual varies by only 15-20% within a day. Cotinine test is hence a useful assay for assessing the exposure to nicotine. The physiological concentration of cotinine in urine of smokers is typically above 50 ng/ml. The cutoff of this assay is however set at 200 ng/ml to exclude false positive results arising out of exposure to passive smoking.
