#### INTERPRETATION:

A lipid profile test measures the different types of lipids in the blood. It measures the levels of four different types of cholesterol and triglycerides.

- •LDL (low-density lipoproteins): LDL is the cholesterol that is considered "bad cholesterol" because it forms plaques in the arteries and adversely affects heart health. Thus, LDL cholesterol should be maintained in the lower range.
- •VLDL (very low-density lipoproteins): VLDL appears in the blood soon after we have consumed food. A lipid profile is done as a fasting test, and thus, if there is an increased level of VLDL in the blood sample, it can be suggestive of some metabolic disease.
- •HDL (high-density lipoproteins): HDL cholesterol is also known as "good cholesterol" because it helps clear away the bad LDL cholesterol and prevents its build-up.
- •Total cholesterol: It is the sum of all the different types of cholesterol in your body, i.e., LDL + VLDL + HDL.
- •Triglycerides: Our body converts the excess calories into triglycerides and stores it as body fat. High levels of triglycerides are harmful to the heart, liver, and pancreas.

#### **INTERPRETATION:**

The LFT test is used to diagnose and monitor liver diseases. It can also provide the information about other health conditions that affect the liver, such as viral or alcoholic hepatitis. If a person is taking medications that can impact on the liver, the test results can indicating whether side effects are occurring.

The thyroid profile test measures the thyroid hormones in the blood. Thyroid gland is responsible for producing hormones important for many bodily processes. Abnormal thyroid function, such as underactive thyroid (hypothyroidism) or overactive thyroid (hyperthyroidism), can lead to many symptoms. A thyroid profile can also be used to monitor the treatment of hyperthyroidism and assess those receiving levothyroxine therapy, which replaces or supplements thyroid hormones reduced or absent due to hypothyroidism, thyroid cancer, thyroid nodules, and goiters.
