Glycosylated Hemoglobin (HbA1C)	6.0	%	- %
ABG(Average Blood Glucose)	125.50	MG/DL	- MG/DL

Methodology: Ion exchange H.P.L.C. Using instrument: D-10 with EDTA

Hemoglobin A1C % Degree of Glucose Control

> 8	Action suggested
< 7	Goal
< 6	Non - Diabetic level

Clinical Information:

Glycated hemoglobin testing is recommended for both (a) checking blood sugar control in people who might be pre-diabetic and (b) monitoring blood sugar control in patients with more elevated levels, termed diabetes mellitus. The American diabetes association guidelines suggest that the Glycosylated hemoglobin test be performed at least two times a year in patients with diabetes that are meeting treatment goals (and that have stable glycemic control) and quarterly in patients with diabetes whose therapy has changed or that are not meeting glycemic goals. Glycated hemoglobin measurement is not appropriate where there has been a change in diet or treatment within 8 weeks. Hence, people with recent blood loss, hemolytic anemia, or genetic differences in the hemoglobin molecule (hemoglobinopathy) such as sickle-cell disease and other conditions, as well as those that have donated blood recently are not suitable for this test.

Primary malfunction of the thyroid gland may result in excessive (hyper) or low (hypo) release of T3 or T4. In addition, as TSH directly affect thyroid function, malfunction of the pituitary or the hypothalamus influences the thyroid gland activity. Disease in any portion of the thyroid-pituitary-hypothalamus system may influence the level of T3 and T4 in the blood. In Primary hypothyroidism, TSH levels are significantly elevated, while in secondary and tertiary hypothyroidism, TSH levels may be low. In addition, in Euthyroid sick Syndrome, multiple alterations in serum thyroid function test findings have been recognized.
