Note : Blood group is identified by ABO antigens (forward grouping) present on red cell membrane And anti-ABO antibodies (reverse grouping) present in the plasma. A grouping discrepancy is when there is a mismatch in forward and reverse Blood grouping. Special methods need to be Performed to solve such discrepancies.

In case of Newborn/cord blood grouping, only forward blood grouping would be done as the anti-ABO antibodies (for reverse grouping) Are not present till 4 to 6 months of age. Thus new born grouping should be considered as provisional report and should be supplemented by re-blood grouping after 4 to 6 months of age/ or by more sensitive tests like molecular blood grouping.

"Blood grouping is done on the received sample. In case of any suspected discrepancy, Blood centre should be contacted, 1724692270"

The patient exercised according to the BRUCE for 9:05 min:s, achieving a work level of Max. METS: 10.40. The resting heart rate of 88 bpm rose to a maximal heart rate of 179 bpm. This value represents 95 % of the maximal, age-predicted heart rate. The resting blood pressure of 110/70 mmHg, rose to a maximum blood pressure of 130/80 mmHg. The exercise test was stopped due to Target heart rate achieved.

Interpretation

Summary: Resting ECG: normal.
Functional Capacity: normal.
HR Response to Exercise: appropriate.
BP Response to Exercise: normal resting BP - appropriate response.
Chest Pain: none.
Arrhythmias: none.
ST Changes: none.
Overall impression: Normal stress test.
