HbA1C	6.0	%	Non-Diabetic level: <6 Good Control: 6 - 7 Poor Control: 7 - 8 Action Suggested > 8
MEAN BLOOD GLUCOSE	125.5	mg/dl	

The test is done on Cobas Integra 400plus-Turbidimetric Inhibition ImmunoAssay

Note:- Criteria for the diagnosis of diabetes HbA1c $\geq 6.5\%$

1. HbA1c is important test for the assessment of long term blood glucose control (also called glycemc control).
2. HbA1C reflects mean glucose concentration over pas 6-8 weeks and provides a much better indication of long term glycemc control than blood glucose determination.
3. HbA1C is formed by non-enzymatic reaction between glucose and Hb. This reaction is irreversible and therefor remains unaffected by short term fluctuations in blood glucose levels.
4. Long term complications of diabetes such as retinopathy,nephropathy, and neuropathy are potentially serious and can lead to blindness kidney failure etc.
5. Genetic Variants (Hb-S trait,Hb-C trait) elevated fetal haemoglobin & chemically modified derivatives of haemoglobin (eg carbamylated Hb in patients with renal failure) can affect the accuracy of HbA1C measurement.

Note:-

Thyroid stimulating hormone (TSH) is synthesized and secreted by the anterior pituitary in response to a negative feedback mechanism involving concentrations of FT3 (free T3) and FT4 (freeT4). Additionally the hypothalamic tripeptide, thyrotropin releasing hormone (TSH) directly stimulates TSH production. TSH stimulates thyroid cell production and hypertrophy also stimulate the thyroid gland to synthesize and secrete T3 and T4.

Quantification of TSH significant to differentiate primary (thyroid) from secondary (pituitary) and tertiary (hypothalamus) hypothyroidism. In primary hypothyroidism, TSH levels are significantly elevated while in secondary and tertiary hypothyroidism, TSH levels are low.
