**HORMONES**

*Immuno Assays were performed on fully automated Advia Centaur Hormone analyzer.*

**TUMOR MARKER**

1539-PSA PROSTATIC SPECIFIC ANTIGEN 0.53 ng/ml

SP-SERUM

Sandwich Direct CLIA

**EXPECTED VALUES :**

99% :	of Healthy males	0.0-4.0 ng/ml
80% :	of Benign prostatic hypertrophy	0.0-4.0 ng/ml
81% :	of Prostatic Carcinoma	Above 4.0 ng/ml

PSA is reliable tumor marker for already diagnosed prostatic carcinoms. It is uniquely associated only with prostatic tissue, and therefore is specific for it. Baseline levels measured prior to therapeutic intervention and followed later by serial periodical measurements with predict the outcome of therapy. It is also helps in early discovery of recurrences, relapses and metastases.

**RECOMMENDED TESTING INTERVALS :**

First Determination	:	Preoperatively (Baseline)
Second Determination	:	2-4 days Postoperatively
Third Determination	:	Before discharge from hospital
Follow-up Determinations	:	
If levels are high/show rising trend	:	Monthly
If levels are normal	:	Every 3 monthly initially, later annually.

In general, tumor marker levels are directly proportional to the tumor mass and the stage of the cancer. However, it is the rate of change of the tumor marker level which is more important, rather than its absolute value. A 50% change may be considered clinically significant. It must be emphasised that PSA may also be elevated in benign prostatic hypertrophy and inflammatory conditions of the surrounding genito urinary tract. Therefore, this parameter should never be used as a screening test for test diagnosing prostatic carcinoma.

indicates hypothalamic or pituitary dysfunction. A high TSH in the presence of normal or high T4 suggests inappropriately increased TSH secretion.

INCREASED LEVELS are seen in primary hypothyroidism, inappropriate TSH secretion, systemic illness, rarely in TSH secreting pituitary tumours (secondary hyperthyroidism).

DECREASED LEVELS are seen in secondary hypothyroidism, Hyperthyroidism.

It is recommended that the determination of HbA1c be performed at intervals of 4 - 6 weeks during diabetes mellitus therapy. Result of HbA1c should be assessed in conjunction with the patient's medical history clinical examination and other findings.
