Interpretation & Remark:

- HbA1c is used for monitoring diabetic control. It reflects the estimated average glucose.
- HbA1c has been endorsed for clinical groups & American Diabetes Association guidelines (A1C) for diagnosis of diabetes using a cut-off point of 6.5%.
- HbA1c is a better indicator of diabetic control than a solitary test.
- Low HbA1c in a non-diabetic individual are often associated with systemic inflammatory disease chronic anemia (Specially severe iron deficiency anemia & hemodialysis), chronic renal failure and liver diseases. Clinical correlation suggested.
- Interference of Hemoglobinopathies in HbA1c estimation:
 - A. For HbF > 20%, an alternate platform (Fructosamine) is recommended for testing of HbA1c.
 - B. Hemoglobin hemoglobinopathy is detected, Fructosamine is recommended for monitoring diabetic status.
 - C. Hemoglobin state detected (HbD) type is corrected for HbF and HbC level.
- For known diabetic patients, following values can be considered as a cut for monitoring the glycemic control:

Excellent Control - 6 - 7 %
 Fair to Good Control - 7 - 8 %
 Unsatisfactory Control - 9 - 10 %
 Poor Control - > 10 %

Note: Hemoglobin electrophoresis (HPLC method) is recommended for detecting hemoglobinopathy.
