TEST NAME	RESULT	UNIT	BIOLOGICAL REF. RANGE
Thyroid Function Test			
T3 (Triiodothyronine) (ECLIA)	0.79	ng/mL	0.8 - 2.02
T4 (Thyroxine) (ECLIA)	6.10	µg/dL	5.1 - 14.06
TSH (ECLIA)	1.26	µIU/ml	0.27 - 4.2

Interpretation(s)

TSH stimulates the production and secretion of the metabolically active thyroid hormones, thyroxine (T₄) and triiodothyronine (T₃), by interacting with a specific receptor on the thyroid cell surface. The synthesis and secretion of TSH is stimulated by Thyrotropin releasing hormone (TRH) in response to low levels of circulating thyroid hormones. Elevated Levels of T₃ and T₄ suppress the production of TSH via a classic negative feedback mechanism. Failure at any level of regulation of the Hypothalamic-pituitary- thyroid axis will result in either underproduction (hypothyroidism) or overproduction (hyperthyroidism) of T₄ and/ or T₃

Limitations:

T₃ and T₄ circulates in reversibly bound form with Thyroid binding globulins (TBG), and to a lesser extent albumin and thyroid binding Pre Albumin. So Conditions in which TBG and protein levels alter Such as pregnancy, excess estrogens, androgens, steroids may falsely affect the T₃ and T₄ levels. Normal levels of T₄ can also be seen in Hyperthyroid patients with: T₃ Thyrotoxicosis, hypoproteinemia Or ingestion of certain drugs. Serum T₄ levels in neonates and infants are higher than values in the normal adult, due to the increased concentration of TBG in neonate serum. TSH may be normal in central hypothyroidism recent rapid correction of hyperthyroidism or hypothyroidism pregnancy. Phenytoin therapy, Autoimmune disorders may produce spurious results. Various drugs can interfere With the test result, TSH has a diurnal rhythm so values may vary if sample collection is done at different times of the day.

PSA is a glycoprotein that is produced by the prostate gland, the lining of the urethra, and the bulbourethral gland. PSA exists in serum mainly in 2 forms, complexed to alpha-1-anti-chymotrypsin and free PSA. Increases in prostatic glandular size and tissue damage caused by benign prostatic hypertrophy, prostatitis, or prostate cancer may increase circulating PSA levels. Transient increase in PSA can also be seen following per rectal digital or sonological examinations. Decrease in total PSA level is seen 24 to 48 hours after ejaculation. Decrease in total PSA level occurs after prostatectomy and orchidectomy. Successful radiation therapy and therapy with anti-androgen drugs result in decline in PSA levels, over a period of time. PSA is also useful for determining possible recurrence after therapy when used in conjunction with other diagnostic indices. PSA levels routinely fall to a very low level, which may not be seen in patients undergoing radiation therapy. Monitoring PSA levels appears to be useful in detecting residual disease and early recurrence of tumor. Serial PSA levels can help determine the success of prostatectomy and the need for further treatment, such as radiation, endocrine or chemotherapy and in the monitoring of the effectiveness of therapy. PSA levels should not be interpreted as absolute evidence of the presence or the absence of malignant disease. Before treatment, patients with confirmed prostate carcinoma frequently have levels of PSA within the range observed in healthy individuals. Elevated levels of PSA can be observed in the patients with non-malignant diseases. Measurement of PSA should always be used in conjunction with other diagnostic procedures, including information from the patient's clinical evaluation. Specimens for total PSA assay should be obtained before biopsy, prostatectomy or prostatic massage, since manipulation of the prostate gland may lead to elevated PSA levels persisting up to 2-3 weeks.
