Final Report

Test Name / Method	Results	Units	Reference Range	Sample Type
CLINICAL BIOCHEMISTRY				
CALCIUM Method : NM-BAPTA	9.3	mg/dl	8.6-10.6	SERUM
Vitamin D (25-OH Vitamin D) Method : ECLIA	11.74	ng/ml	Deficiency:<10 Insufficiency: 10-30 Sufficiency:30-100 Toxicity: > 100	

Interpretation Notes :

Vitamin D is a group of fat-soluble secosteroids responsible for increasing intestinal absorption of Calcium, Magnesium and Phosphate and many other biological effects. In humans, the most important compounds in the group are vitamin D3 (also known as cholecalciferol- animal source) and Vitamin D2 (ergocalciferol- Plant source & fortification). It is also produced endogenously when ultraviolet (UV) rays from sunlight strike the skin and trigger vitamin D synthesis.

Both D2 and D3 are inactive and get activated by Hydroxylation reactions in the liver and kidneys. **These two vitamin D metabolites are measured as total vitamin D in serum to determine a person's vitamin D status.**

Serum concentration of 25(OH) D is currently the main indicator of vitamin D status. It reflects vitamin D produced endogenously and that obtained from foods and supplements. **The 25-hydroxy vitamin D test is the best way to monitor vitamin D levels.** The amount of 25-hydroxyvitamin D in your blood is a good indication of how much vitamin D your body has. The test can determine if your vitamin D levels are too high or too low.
