Interpretation(s)

RBC AND PLATELET INDICES-Number Index (MCV/MC) is an automated cell-counter based calibrated screen tool to differentiate cases of iron deficiency anaemia[13] from beta thalassemia trait (<11) in patients with microcytic anaemia. This needs to be interpreted in line with clinical condition and suspicion. Estimation of HbA2 remains the gold standard for diagnosing a case of beta thalassemia trait. WBC DIFFERENTIAL COUNT-the optimal threshold of 3.3 for NLR showed a prognostic possibility of distal symptoms to change from mild to severe in COVID positive patients. When age = 49.5 years old and NLR = 3.3, 46.1% COVID-19 patients with mild disease might become severe. By contrast, when age < 49.5 years old and NLR < 3.3, COVID-19 patients tend to show mild disease. The diagnostic and predictive role of NLR, d-NLR and PLR in COVID-19 patients [A-F, Yang, et al.; International Immunopharmacology 84 (2020) 106504 This tool deliver is a calculated parameter and out of NABL scope.

Interpretation(s)

EXHAUSTIVE DESCRIPTION RATE (ESR), ESR, BLOOD-TEST DESCRIPTION :-

Erythrocyte sedimentation rate (ESR) is a test that indirectly measures the degree of inflammation present in the body. The test actually measures the rate of fall (sedimentation) of erythrocytes in a sample of blood that has been placed into a test tube, vertical tube. Results are reported as the millimetres of clear fluid (plasma) that are present at the top portion of the tube after one hour, weekdays. Fully automated instruments are available to measure ESR.

ESR is not diagnostic; it is a non-specific test that may be elevated in a number of different conditions. It provides general information about the presence of an inflammatory condition. CRP is superior to ESR because it is more sensitive and reflects a more rapid change.

TEST INTERPRETATION

Increase in: Infection, Vasculitis, Inflammatory arthritis, renal disease, anemia, Myeloproliferative and plasma cell dyscrasias, Acute allergy tissue injury, Pregnancy, Ectopic medication, Aging.

Findings a very accelerated ESR(>100 mm/hour) in patients with ill-defined symptoms directs the physician to search for a systemic disease (Paraneoplastic, Disseminated malignancy, connective tissue disease, severe infectious such as bacterial endocarditis).

Decreased in: Polycythemia vera, Sickle cell anemia

LIMITATIONS

False elevated ESR : Increased fibrinogen, Drugs(Vitamin A, Dextran etc), Hypothyroidism

False decreased : Polycythemia, (Sickle cell anemia), Myeloproliferative disorders, Low fibrinogen, Very high WBC counts, Drugs(Quinine, salicylates)

The adult reference range is "Fasting Hematology by Glucose and Lactin, 10th edition, GLYCOSYLATED HEMOGLOBIN(HbA1c), EDTA WHOLE BLOOD-Used For:

1. Evaluating the long-term control of blood glucose concentrations in diabetic patients.

2. Diagnosing diabetes.

3. Identifying patients at increased risk for diabetes (prediabetes).

The ADA recommends measurement of HbA1c (typically 3-4 times per year for type 1 and poorly controlled type 2 diabetic patients, and 2 times per year for well-controlled type 2 diabetic patients) to determine whether a patient's metabolic control has remained consistently within the target range.

1. HbA1c (Estimated average glucose) converts percentage HbA1c to mg/dL to compare blood glucose levels.

2. HbA1c gives an evaluation of blood glucose levels for the last couple of months.

3. HbA1c is calculated as $HbA1c (mg/dL) = 28.7 + HbA1c (\%) \times 46.7$

HbA1c estimation can get affected due to:

1. Shortened Erythrocyte survival : Any condition that shortens erythrocyte survival or decreases mean erythrocyte age (e.g. recovery from acute blood loss, hemolytic anemia) will falsely lower HbA1c test results. Fructosamine is recommended in these patients which indicates diabetes control over 15 days.

2. Variant C & E are reported to falsely lower test results, possibly by affecting glycation of hemoglobin.

3. Iron deficiency anemia is reported to increase test results. Hypertrophy of anemia, uremia, hyperbilirubinemia, chronic alcoholism, chronic ingestion of salicylates & opiates addition are reported to interfere with some assay methods. Slightly increasing results.

4. Interference of hemoglobinopathies in HbA1c estimation is seen in

a) Nonzygous hemoglobinopathy. Fructosamine is recommended for testing of HbA1c.

b) Heterozygous state detected (D10 is corrected for HbS & HbC trait.)

c) HbF > 25% on alternate pattern (chromosome affinity chromatography) is recommended for testing of HbA1c. Abnormal hemoglobin electrophoresis (HPLC method) is recommended for detecting a hemoglobinopathy

METHOD : TRUE AGGLUTINATION

Interpretation(s)
 ABO GROUP & RH TYPE, EDTA WHOLE BLOOD-group is identified by antigens and antibodies present in the blood. Antigens are protein molecules found on the surface of red blood cells. Antibodies are found in plasma. To determine blood group, red cells are mixed with different antibody solutions to give A, B, O or AB.

Disclaimer: "These notes, as the results of previous ABO and Rh group (Blood Group) for pregnant women are not available, please check with the patient records for availability of the same."

The test is performed by both forward as well as reverse grouping method.
