1559-THYROID PROFILE

1560-TOTAL TRIIODOTHYRONINE (T3) Competitive CLIA	1.34	ng/ml	0.69 - 2.15
1561-TOTAL THYROXINE (T4) Competitive CLIA	8.8	ug/dl	5.5 - 12.5
1562-THYROID STIMULATING HORMONES (TSH) Sandwich CLIA	1.49	uIU/ml	0.50 - 5.00

INTERPRETATION:

THYROID STIMULATING HORMONE (TSH)

The TSH levels are inversely related to T3 & T4 levels. In primary hypothyroidism TSH levels are high while T3&T4 levels are low whereas in primary hyperthyroidism TSH levels are low with high T3&T4 levels. A low T3 & T4 in the presence of low or normal TSH indicates hypothalamic or pituitary dysfunction. A high TSH in the presence of normal or high T4 suggests inappropriate TSH secretion.

INCREASED LEVELS are seen in primary hypothyroidism, inappropriate TSH secretion, systemic illness, rarely in TSH secreting pituitary tumours (secondary hyperthyroidism).

DECREASED LEVELS are seen in secondary hypothyroidism, Hyperthyroidism.

INTERPRETATION:

Serum T3, T4, TSH measurements from the three components of Thyroid screening panel.

TRIODOTHYRONINE (T3)

INCREASED LEVELS are seen in graves disease, T3 thyrotoxicosis, Thyroid hormone resistance, Functional thyroid adenoma.
 DECREASED LEVELS are seen IN Nonthyroidal illness, Hypothyroidism (one third cases)

THYROXINE (T4) - Normal T4 levels accomplished by elevated T3 levels seen in T3 Thyroxiosis.

INCREASED LEVELS are seen in hyperthyroidism, Thyroid hormone resistance.

REMARKS :-

In vitro quantitative determination of HbA1c in whole blood is utilized. In long term monitoring of glycemia. The HbA1c level correlates with the mean glucose concentration prevailing in the course of the patient's recent history (approx - 6 - 8 weeks) and therefore provides determination of blood glucose or urinary glucose. It is recommended that the determination of HbA1c be performed at intervals of 4 - 6 weeks during diabetes mellitus therapy. Result of HbA1c should be assessed in conjunction with the patient's medical history clinical examination and other findings.

TRIGLYCERIDE level > 250mg/dL is associated with an approximately 2-fold greater risk of coronary vascular disease. Elevation of triglycerides can be seen with obesity, medication,

fast, less than 100 mg/dL, and alcohol intake. Cholesterol and triglycerides are the important plasma lipids in defining cardiovascular risk factors and in the management of cardiovascular disease. Highest acceptable cholesterol and optimal target lipid levels for 2023 are as follows: Total cholesterol vary with age. Values above 220 mg/dL are associated with increased risk of CHD mortality.
