USG FOR ABDOMEN

LIVER:

The echogenicity of the liver is normal.
There is no focal liver lesion.
There are no dilated intrahepatic biliary radicles.

GALL BLADDER:

Appears to be distended and shows no calculus or polyp in the lumen.
Wall thickness is normal.

SPLEEN:

The echogenicity of the spleen is normal.
There is no focal splenic lesion.

PANCREAS:

The echogenicity appears to be normal.
There is no free fluid in the abdomen.
There are no enlarged retroperitoneal lymphnodes.

KIDNEY:

The kidneys are normal in position, size, shape and outline.
The parenchyma is normal. Right kidney measure 95*35 cm.
Left kidney measure 92*38 cm.

BLADDER:

Bladder is well distended and shows normal wall thickness. No evidence of intraluminal mass or calculi.

UTERUS : Normal in size ,contour, and echotexture.

Both ovaries appears normal in size and echotexture. No adnexal mass lesions.

There is no evidence of ascites.

No evidence of any gross bowel mass seen.

No evidence of any aorto-caval or mesenteric root lymphadenopathy.

Appendix cannot be imaged.No mass or collection in right iliac fossa.

BLOOD GROUP

BG

| Investigation | Observed Value | Biological Reference Interval | Unit |
|---|----------------|-------------------------------|------|
| BLOOD GROUP, ABO & RH TYPING | | | |
| ABO Group | "B" | | |
| RH Factor | POSITIVE | | |

The test to determine your blood group is called ABO typing. Your blood sample is mixed with antibodies against type A and B blood. Then, the sample is checked to see whether or not the blood cells stick together. If blood cells stick together, it means the blood reacted with one of the antibodies.

Rhesus (Rh) factor is an inherited protein found on the surface of red blood cells. **If your blood has the protein, you're Rh positive. If your blood lacks the protein, you're Rh negative.**

HBA1C

| Investigation | Observed Value | Biological Reference Interval | Unit |
|--------------------|----------------|--|-------|
| HBA1c | 5.23 | For Screening: Diabetes: >6.5% Pre-Diabetes: 5.7% - 6.4% Non-Diabetes: < 5.7% | |
| Mean Blood Glucose | 103.40 | For Diabetic Patient: Poor Control : > 7.0 % Good Control : 6.0-7.0 % | mg/dL |

Comment

- HbA1c is an indicator of glycemic control. HbA1c represents average Glycemia over the past six to eight weeks. Glycation of Hemoglobin occurs over the entire 120 day life span of the Red Blood Cell, but within this 120 days. Clinical studies suggest that a patient in stable control will have 50% of their HbA1c formed in the month before sampling, 25% in the month before that, and the remaining 25% in months two to four.
- Mean Plasma Glucose mg/dL = $28.7 \times A1C - 46.7$. Correlation between HbA1c and Mean Plasma Glucose (MPG) is not "perfect" but rather only this means that to predict or estimate average glucose from HbA1c or vice-versa is not "perfect" but gives a good working ballpark estimate.
- Afternoon and evening results correlate more closely to HbA1c than morning results, perhaps because morning fasting glucose levels vary much more than daytime Glucose levels, which are easier to predict and control. As per IFCC recommendations 2007, HbA1c being reported as above maintaining traceability to both IFCC (mmol/mol) & NGSP (%) units.

Clinical Information:

Liver function tests, also known as liver chemistries, help determine the health of your liver by measuring the levels of proteins, liver enzymes, and bilirubin in your blood. Having abnormal results on any of these liver tests typically requires follow up to determine the cause of the abnormalities. Even mildly elevated results can be associated with liver disease. However, these enzymes can also be found in other places besides the liver.

Talk to your doctor about the results of your liver function test and what they may mean for you.
