Glycated Haemoglobin Estimation

HbA1C	5.35	% of total Hb	<5.7: Normal 5.7-6.4: Prediabetes >=6.5: Diabetes	
Estimated Avg Glucose (3 Mths) Calculated	106.84	mg/dL	Not available	

Please Note change in reference range as per ADA 2021 guidelines.

Interpretation :

HbA1C level reflects the mean glucose concentration over previous 8-12 weeks and provides better indication of long term glycaemic control. Levels of HbA1C may be low as result of shortened RBC life span in case of hemolytic anemia.

Increased HbA1C values may be found in patients with polycythemia or post splenectomy patients.

Patients with Heterozygous forms of rare variant Hb(Cc,SS,EE,SC) HbA1c can not be quantitated as there is no HbA.

In such circumstances glycaemic control can be monitored using plasma glucose levels or serum Fructosamine.

The A1c target should be individualized based on numerous factors, such as age, life expectancy, comorbid conditions, duration of diabetes, risk of hypoglycemia or adverse consequences from hypoglycemia, patient motivation and adherence.

THE NEW YORK STATE BAR ASSOCIATION

The New York State Bar Association is a voluntary association of lawyers and judges in the State of New York, organized for the purpose of promoting the highest quality of the legal profession and the administration of justice in this State.

Its principal objectives are:

1. To improve the quality of the legal profession.
2. To promote the highest standards of conduct and ethics among lawyers and judges.

The Association is composed of members who are admitted to the practice of law in the State of New York. It is organized into sections, divisions, and committees, each of which is authorized to carry out its respective duties and responsibilities.

The Association's activities include:

1. The promotion of continuing legal education for lawyers and judges.
2. The establishment of a system of public defenders.
3. The improvement of the judicial system.

The Association also sponsors a variety of programs and services, including the New York State Bar Journal, the New York State Bar Association Foundation, and the New York State Bar Association Law Center.

The Association is a non-profit organization and is governed by a Board of Governors.

The Association's headquarters are located at 110 West Street, New York, New York 10038.

TEST	RESULTS	UNIT	BIOLOGICAL REF RANGE	REMARKS
------	---------	------	----------------------	---------

Thyroid Function Test

Triiodothyronine (T3)	89.36	ng/dL	70 - 204	
Thyroxine (T4) <i>C/M/A</i>	6.09	ng/dL	4.87 - 11.72	
TSH <i>C/M/A</i>	3.92	µIU/mL	0.4 - 4.2	

INTERPRETATIONS

- Circulating TSH measurement has been used for screening for euthyroidism, screening and diagnosis for hyperthyroidism & hypothyroidism. Suppressed TSH (<0.01 µIU/mL) suggests a diagnosis of hyperthyroidism and elevated concentration (>7 µIU/mL) suggest hypothyroidism. TSH levels may be affected by acute illness and several medications including dopamine and glucocorticoids. Decreased (low or undetectable) in Graves disease. Increased in TSH secreting pituitary adenoma (secondary hyperthyroidism), PRTH and in hypothalamic disease thyrotropin (tertiary hyperthyroidism). Elevated in hypothyroidism (along with decreased T4) except for pituitary & hypothalamic disease.
- Mild to modest elevations in patient with normal T3 & T4 levels indicates impaired thyroid hormone reserves & incipient hypothyroidism (subclinical hypothyroidism).
- Mild to modest decrease with normal T3 & T4 indicates subclinical hyperthyroidism.
- Degree of TSH suppression does not reflect the severity of hyperthyroidism, therefore, measurement of free thyroid hormone levels is required in patient with a suppressed TSH level.

CAUTIONS

Sick, hospitalized patients may have falsely low or transiently elevated thyroid stimulating hormone. Some patients who have been exposed to animal antigens, either in the environment or as part of treatment or imaging procedure, may have circulating antianimal antibodies present. These antibodies may interfere with the assay reagents to produce unreliable results.

Interpretation Note:

Ultra sensitive thyroid-stimulating hormone (TSH) is a highly effective screening assay for thyroid disorders. In patients with an intact primary-thyroid axis, suppressed s-TSH provides a physiologic indicator of the functional level of thyroid hormone activity. Increased s-TSH indicates inadequate thyroid hormone, and suppressed s-TSH indicates excess thyroid hormone. Transient s-TSH abnormalities may be found in severely ill, hospitalized patients, so this is not the ideal setting to detect thyroid function. However, even in these patients, s-TSH works better than total thyroxine (an alternative screening test), when the s-TSH result is abnormal, appropriate follow-up tests T4 & free T3 levels should be performed. If TSH is between 5.0 to 10.0 & free T4 & free T3 level are normal then it is considered as subclinical hypothyroidism which should be followed up after 4 weeks & if TSH is > 10 & free T4 & free T3 level are normal then it is considered as overt hypothyroidism.

Serum triiodothyronine (T3) levels often are depressed in sick and hospitalized patients, caused in part by the biochemical shift to the production of reverse T3. Therefore, T3 generally is not a reliable predictor of hypothyroidism. However, in a small subset of hyperthyroid patients, hypothyroidism may be caused by overproduction of T3 (T3 toxicosis). To help diagnose and monitor this subgroup, T3 is measured on all specimens with suppressed s-TSH and normal FT4 concentrations.

Normal ranges of TSH & thyroid hormones vary according trimester in pregnancy.
