In primary hypothyroidism, thyroid stimulating hormone(TSH) levels will be elevated and in primary hyperthyroidism, TSH levels will be low. In Hypothyroidism there is decreased production of thyroid constipation, cold intolerance, and fatigue. Iodine deficiency and Hashimoto thyroids is the most common cause of hypothyroidism. If the thyroid releases inappropriately large amounts of T4 and T3, the affected person may experience symptoms associated with Hyperthyroidism, such as rapid heart rate, weight loss, nervousness, hand tremors, irritated eyes, and dofficulty in sleeping. Graves disease is the most common cause of hypertgyroidism. Several medications including dopamine and glucucorticoids or excessive use of dietary supplements containing. Biotin may affect TSH results. For diafnostic purpose a test result should always be assessed in conjunction with the individuals medical history, clinical examination and other findings.
