Mean Blood Glucose	99.62 mg/dl	
Method	Nycocard	

Note

Glycosylated hemoglobin(hemoglobin A1c,HbA1c,A1C,or Hb1c, sometimes also HbA1c) is a form of hemoglobin used primary to identify the average plasma glucose concentration over prolonged periods of time. It is formed in a non-enzymatic pathway by hemoglobin's normal exposure to high plasma levels of glucose. Glycation of hemoglobin has been associated with cardiovascular disease, nephropathy and retinopathy in diabetes mellitus. Monitoring the Hb1C in type-1 diabetic patients may improve treatment. HbA1c is a weighted average of blood glucose levels during the preceding 120 days, which is the average life span of red blood cells. A large change in mean blood glucose can increase HbA1c levels within 1-2 weeks. Sudden changes in HbA1c may occur because recent changes in blood glucose levels contribute relatively more to the final HbA1c levels than earlier' events. For instance, mean blood glucose levels in the 30 days immediately preceding blood sampling contribute 50% to the HbA1c level, whereas glucose levels in the preceding 90-120 day period contribute only 10%. Thus, it does not make 120 days to detect a clinically meaningful change in HbA1c following a significant change in mean plasma glucose level.
