METHOD: HIGH PERFORMANCE LIQUID CHROMATOGRAPHY (HPLC)
(BIODIAG DIASTAT)

EXPECTED VALUES:

Metabolically healthy patients = 4.8 - 6.0 % HbA1C
Good Control = 5.5 - 6.8 % HbA1C
Fair Control = 6.8-8.2 % HbA1C
Poor Control = >8.2 % HbA1C

Biomedical Ref Range

HbA1C ESTIMATED AVERAGE GLUCOSE (eAG) 164.94

REMARKS:

In vitro quantitative determination of HbA1C in whole blood is utilized in long term monitoring of glycemia. The HbA1C level correlates with the mean glucose concentration prevailing in the course of the patient's recent history (approx. 6-8 weeks) and therefore provides much more reliable information for glycemia monitoring than do determinations of blood glucose or urinary glucose.

It is recommended that the determination of HbA1C be performed at intervals of 4-5 weeks during diabetes mellitus therapy. Results of HbA1C should be assessed in conjunction with the patient's medical history, clinical examinations and other findings.

Estimated average glucose (eAG) - There is a predictable relationship between HbA1c and eAG. It helps people with diabetes to correlate their A1c to daily glucose monitoring levels. It reflects the average glucose levels in the past 2 - 3 months. The eAG calculation converts the A1c percentage to the units units used by glucometers-eq/ptl. The following table shows the relationship of eAG and A1c.

HbA1c (%)	eAG (mg/dL)
5	97
6	126
7	154
8	183
9	212
10	240
11	269
12	298
