HAEMATOLOGY

Erythrocyte Sedimentation Rate (ESR)
Method - Westergren

14

mm in 1st hr

00 - 15

The erythrocyte sedimentation rate (ESR or sed rate) is a relatively simple, inexpensive, non-specific test that has been used for many years to help detect inflammation associated with conditions such as infections, cancers, and autoimmune diseases. ESR is said to be a non-specific test because an elevated result often indicates the presence of inflammation but does not tell the health practitioner exactly where the inflammation is in the body or what is causing it. An ESR can be affected by other conditions besides inflammation. For this reason, the ESR is typically used in conjunction with other tests, such as C-reactive protein. ESR is used to help diagnose certain specific inflammatory diseases, including temporal arteritis, systemic vasculitis and polymyalgia rheumatica. (For more on these, read the article on Vasculitis.) A significantly elevated ESR is one of the main test results used to support the diagnosis. This test may also be used to monitor disease activity and response to therapy in both of the above diseases as well as

HAEMATOLOGY

Test Name	Value	Unit	Biological Ref Interval
GLYCOSYLATED HEMOGLOBIN (HbA1C) Method:- CAPILLARY with EDTA	5.4	mg%	Non-Diabetic < 6.0 Good Control 6.0-7.0 Weak Control 7.0-8.0 Poor control > 8.0
MEAN PLASMA GLUCOSE Method:- Calculated Parameter	106	mg/dL	68 - 125

INTERPRETATION

AS PER AMERICAN DIABETES ASSOCIATION (ADA)

Reference Group HbA1c in %

Non diabetic adults >=18 years < 5.7

At risk (Prediabetes) 5.7 - 6.4

Diagnosing Diabetes >= 6.5

CLINICAL NOTES

In vitro quantitative determination of HbA1c in whole blood is utilized in long term monitoring of glycemia. The HbA1c level correlates with the mean glucose concentration prevailing in the course of the patient's recent history (approx - 8-12 weeks) and therefore provides much more reliable information for glycemia monitoring than do determinations of blood glucose or urinary glucose. It is recommended that the determination of HbA1c be performed at intervals of 4-8 weeks during Diabetes Mellitus therapy. Results of HbA1c should be assessed in conjunction with the patient's medical history, clinical examinations and other findings.

Some of the factors that influence HbA1c and its measurement (Adapted from Gallagher et al.)

1. Erythropoiesis

- Increased HbA1c: iron, vitamin B12 deficiency, decreased erythropoiesis

- Decreased HbA1c: administration of erythropoietin, iron, vitamin B12, reticulocytosis, chronic liver disease

2. Altered Haemoglobin-Genetic or chemical alterations in hemoglobin, hemoglobinopathies, HbF, methemoglobin, may increase or decrease HbA1c

3. Glycation

- Increased HbA1c: alcoholism, chronic renal failure, decreased intracellular pH

- Decreased HbA1c: certain hemoglobinopathies, increased intra-erythrocyte pH

4. Erythrocyte destruction

- Increased HbA1c: increased erythrocyte life span: Splenectomy

- Decreased A1c: decreased RBC life span: hemoglobinopathies, splenomegaly, rheumatoid arthritis or drugs such as antiretrovirals, ribavirin & dapstone.

5. Others

- Increased HbA1c: hyperlipidemia, carbamylated hemoglobin, alcoholism, large doses of aspirin, chronic opiate use, chronic renal failure

- Decreased HbA1c: hypertriglyceridemia, reticulocytosis, chronic liver disease, aspirin, vitamin C and E, splenomegaly, rheumatoid arthritis or drugs

BIOCHEMISTRY

Test Name	Value	Unit	Biological Ref Interval
LIPID PROFILE			
TOTAL CHOLESTEROL Method:- CHOD-PAP methodology	199.00	mg/dl	Desirable <200 Borderline 200-239 High > 240
InstrumentName: MISPA PLUS Interpretation: Cholesterol measurements are used in the diagnosis and treatments of lipid lipoprotein metabolism disorders.			
TRIGLYCERIDES Method:- GPO-PAP	118.00	mg/dl	Normal <150 Borderline high 150-199 High 200-499 Very high >500
InstrumentName: Randox Rx Imola Interpretation : Triglyceride measurements are used in the diagnosis and treatment of diseases involving lipid metabolism and various endocrine disorders e.g. diabetes mellitus, nephrosis and liver obstruction.			
DIRECT HDL CHOLESTEROL Method:- Direct clearance Method	46.90	mg/dl	MALE- 30-70 FEMALE - 30-85
Instrument Name: Rx Daytona plus Interpretation: An inverse relationship between HDL-cholesterol (HDL-C) levels in serum and the incidence/prevalence of coronary heart disease (CHD) has been demonstrated in a number of epidemiological studies. Accurate measurement of HDL-C is of vital importance when assessing patient risk from CHD. Direct measurement gives improved accuracy and reproducibility when compared to precipitation methods.			
LDL CHOLESTEROL Method:- Calculated Method	132.43	mg/dl	Optimal <100 Near Optimal/above optimal 100-129 Borderline High 130-159 High 160-189 Very High > 190
VL.DL CHOLESTEROL Method:- Calculated	23.60	mg/dl	0.00 - 80.00
T.CHOLESTEROL/HDL CHOLESTEROL RATIO Method:- Calculated	4.24		0.00 - 4.90
LDL / HDL CHOLESTEROL RATIO Method:- Calculated	2.82		0.00 - 3.50
TOTAL LIPID Method:- CALCULATED	587.17	mg/dl	400.00 - 1000.00

- Measurements in the same patient can show physiological & analytical variations. Three serial samples 1 week apart are recommended for Total Cholesterol, Triglycerides, HDL & LDL Cholesterol.
- As per NCEP guidelines, all adults above the age of 20 years should be screened for lipid status. Selective screening of children above the age of 2 years with a family history of premature cardiovascular disease or those with at least one parent with high total cholesterol is

BIOCHEMISTRY

LIVER PROFILE WITH GGT

SERUM BILIRUBIN (TOTAL) Method- DMSO/Diaz	0.99	mg/dL	Infants : 0.2-8.0 mg/dL Adult - Up to - 1.2 mg/dL
SERUM BILIRUBIN (DIRECT) Method- DMSO/Diaz	0.44	mg/dL	Up to 0.40 mg/dL
SERUM BILIRUBIN (INDIRECT) Method- Calculated	0.55	mg/dl	0.30-0.70
SGOT Method- IFCC	38.7	U/L	0.0 - 40.0
SGPT Method- IFCC	48.6 H	U/L	0.0 - 40.0
SERUM ALKALINE PHOSPHATASE Method- DGKC - SCE	87.20	U/L	53.00 - 141.00
SERUM GAMMA GT Method- Szasz methodology Interferent Name Rankin Rx Insula Interpretation: Elevations in GGT levels occur earlier and more pronounced than those with other liver enzymes in cases of obstructive jaundice and metastatic neoplasms. It may reach 5 to 20 times normal levels in intra- or post-hepatic biliary obstruction. Only moderate elevations in the enzyme level (2 to 3 times normal) are observed with infectious hepatitis.	21.30	U/L	10.00 - 45.00
SERUM TOTAL PROTEIN Method- Direct Buret Reagent	6.74	g/dl	6.00 - 8.40
SERUM ALBUMIN Method- Bromocresol Green	4.32	g/dl	3.50 - 5.50
SERUM GLOBULIN Method- CALCULATION	2.42	gm/dl	2.20 - 3.50
A/G RATIO	1.79		1.30 - 2.50

Interpretation : Measurements obtained by this method are used in the diagnosis and treatment of a variety of diseases involving the liver, kidney and bone marrow as well as other metabolic or nutritional disorders.

Note :- These are group of tests that can be used to detect the presence of liver disease, distinguish among different types of liver disorders, gauge the extent of known liver damage, and monitor the response to treatment. Most liver diseases cause only mild symptoms initially, but these diseases must be detected early. Some tests are associated with functionality (e.g., albumin), some with cellular integrity (e.g., transaminase), and some with conditions linked to the biliary tract (gamma-glutamyl transferase and alkaline phosphatase). Conditions with elevated levels of ALT and AST include hepatitis A,B,C ,paracetamol toxicity etc. Several biochemical tests are useful in the evaluation and management of patients with hepatic dysfunction. Some or all of these measurements are also carried out (usually about twice a year for routine cases) on those individuals taking certain medications, such as anticonvulsants, to ensure that the medications are not adversely impacting the person's liver.

BIOCHEMISTRY

RFT / KFT WITH ELECTROLYTES

SERUM UREA Method:- Urease/GLDH	30.20	mg/dl	10.00 - 50.00
------------------------------------	-------	-------	---------------

InstrumentName: HORIBA CA 60 Interpretation : Urea measurements are used in the diagnosis and treatment of certain renal and metabolic diseases.

SERUM CREATININE Method:- Jaffe's Method	1.08	mg/dl	Males : 0.6-1.50 mg/dl Females : 0.6 -1.40 mg/dl
---	------	-------	---

Interpretation :

Creatinine is measured primarily to assess kidney function and has certain advantages over the measurement of urea. The plasma level of creatinine is relatively independent of protein ingestion, water intake, rate of urine production and exercise. Depressed levels of plasma creatinine are rare and not clinically significant.

SERUM URIC ACID	4.32	mg/dl	2.40 - 7.00
-----------------	------	-------	-------------

InstrumentName: HORIBA YUMIZEN CA60 Daytona plus Interpretation: Elevated Urate: High purine diet, Alcohol, Renal insufficiency, Drugs, Polycythaemia vera, Malignancies, Hypothyroidism, Rare enzyme defects, Downs syndrome, Metabolic syndrome, Pregnancy, Gout.

SODIUM Method:- ISE	139.7	mmol/L	135.0 - 150.0
------------------------	-------	--------	---------------

POTASSIUM Method:- ISE	3.99	mmol/L	3.50 - 5.50
---------------------------	------	--------	-------------

CHLORIDE Method:- ISE	99.3	mmol/L	94.0 - 110.0
--------------------------	------	--------	--------------

SERUM CALCIUM Method:- Arsenazo III Method	9.89	mg/dl	8.80 - 10.20
---	------	-------	--------------

InstrumentName: MISPA PLUS Interpretation: Serum calcium levels are believed to be controlled by parathyroid hormone and vitamin D. Increases in serum PTH or vitamin D are usually associated with hypercalcemia. Hypocalcemia may be observed in hypoparathyroidism, nephrosis and pancreatitis.

SERUM TOTAL PROTEIN Method:- Direct Buret Reagent	6.74	g/dl	6.00 - 8.40
--	------	------	-------------

SERUM ALBUMIN Method:- Bromocresol Green	4.32	g/dl	3.50 - 5.50
---	------	------	-------------

SERUM GLOBULIN Method:- CALCULATION	2.42	gm/dl	2.20 - 3.50
--	------	-------	-------------

A/G RATIO	1.79		1.30 - 2.50
-----------	------	--	-------------

Interpretation : Measurements obtained by this method are used in the diagnosis and treatment of a variety of dis... liver, kidney and

BIOCHEMISTRY

bone marrow as well as other metabolic or nutritional disorders.

INTERPRETATION

Kidney function tests are group of tests that can be used to evaluate how well the kidneys are functioning. Creatinine is a waste product that comes from protein in the diet and also comes from the normal wear and tear of muscles of the body. In blood, it is a marker of GFR. In urine, it can remove the need for 24-hour collections for many analytes or be used as a quality assurance tool to assess the accuracy of a 24-hour collection. Higher levels may be a sign that the kidneys are not working properly. As kidney disease progresses, the level of creatinine and urea in the blood increases. Certain drugs are nephrotoxic hence KFT is done before and after initiation of treatment with these drugs.

Low serum creatinine values are rare; they almost always reflect low muscle mass.

Apart from renal failure Blood Urea can increase in dehydration and GI bleed

1 - 11 Months:0.90 - 7.70 | Prepubertal children:0.60 - 5.50.Primary malfunction of the thyroid gland may result in hyper or low release of T3 or T4

In additional as TSH directly affect thyroid function malfunction of the pituitary or the hypothalamus influences the thyroid gland activity. Disease in

any portion of the thyroid pituitary hypothalamus system may influence the level of T3 and T4 in the blood in Primary hypo thyroidism TSH levels

are usually elevated while in secondary and tertiary hypothyroidism TSH levels may be low

THYROID THYROXINE (T4)

Method- TCLIA

3.38 ug/dl

5.10 - 14.10

NOTE-TSH levels are subject to circadian variation, reaching peak levels between 2-4 AM and min between 6-10 PM. The variation is the order of 50% hence time of the day has influence on the measured serum TSH concentration.Dose and time of drug intake also influence the test result. Transient increase in TSH levels or abnormal TSH levels can be seen in some non thyroidal conditions.Simultaneous measurement of TSH with free T4 is useful in evaluating differential diagnosis

INTERPRETATION-Ultra Sensitive 4th generation assay 1.Primary hyperthyroidism is accompanied by (serum T3 & T4 values along with *TSH level,2.Low TSH,high FT4 and TSH receptor antibody(TRAb)

*+ve seen in patients with Graves disease 3.Low TSH,high FT4 and TSH receptor antibody(TRAb) +ve seen in patients with Toxic adenoma/Toxic Multinodular goiter 4.HighTSH,Low FT4 and Thyroid microsomal

antibody increased seen in patients with Hashimoto's thyroiditis 5.HighTSH,Low FT4 and Thyroid microsomal antibody normal seen in patients with iodine deficiency/Congenital T4 synthesis deficiency 6.Low

TSH,Low FT4 and TRH stimulation test .Delayed response seen in patients with Tertiary hypothyroidism

7.Primary hypothyroidism is accompanied by ; serum T3 and T4 values & *serum TSH level>6.Normal T4 levels accompanied by * T3 levels and low TSH are seen in patients with T3 Thyrotoxicosis8.Normal or T3 & T

10.Normal T3 & T4 along with * TSH indicate mild / Subclinical Hyperthyroidism .11.Normal T3 & * T4 along with * TSH is seen in Hypothyroidism. 12.Normal T3 & T4 levels with * TSH in>5ate Mild / Subclinical Hypoth

DURING PREGNANCY - REFERENCE RANGE for TSH IN uIU/mL (As per American Thyroid Association) 1st Trimester : 0.10-2.50 uIU/mL, 2nd Trimester : 0.20-3.00 uIU/ml, 3rd Trimester : 0.30-3.00

uIU/mL. The production, circulation, and degradation of thyroid hormones are altered throughout the stages of pregnancy.

REMARK-Assay results should be interpreted in context to the clinical condition and associated results of other investigations. Previous treatment with corticosteroid therapy may result in lower TSH levels while

thyroid hormone levels are normal. Results are invalidated if the client has undergone a radioiodine scan within 7-14 days before the test. Abnormal thyroid test findings often found in critically ill patients should be

repeated after the critical nature of the condition is resolved.TSH is an important marker for the diagnosis of thyroid dysfunction.Recent studies have shown that the TSH distribution progressively shifts to a higher

concentration with age, and it is debatable whether this is due to a real change with age or an increasing proportion of unrecognized thyroid disease in the elderly.

TSH 1.304 uIU/mL 0.350 - 5.500

Method- ECLIA

IMMUNOASSAY

4th Generation Assay,Reference ranges vary between laboratories

PREGNANCY - REFERENCE RANGE for TSH IN uIU/mL (As per American Thyroid Association)

- 1st Trimester : 0.10-2.50 uIU/mL
- 2nd Trimester : 0.20-3.00 uIU/mL
- 3rd Trimester : 0.30-3.00 uIU/mL

The production, circulation, and disintegration of thyroid hormones are altered throughout the stages of pregnancy.

NOTE-TSH levels are subject to circadian variation, reaching peak levels between 2-4 AM and min between 6-10 PM. The variation is the order of 50% hence time of the day has influence on the measures serum TSH concentration. Dose and time of drug intake also influence the test result.

INTERPRETATION

- 1.Primary hyperthyroidism is accompanied by ↑serum T3 & T4 values along with ↓ TSH level.
- 2.Primary hypothyroidism is accompanied by ↓ serum T3 and T4 values & ↑serum TSH levels
- 3.Normal T4 levels accompanied by ↑ T3 levels and low TSH are seen in patients with T3 Thyrotoxicosis
- 4.Normal or ↓ T3 & ↑T4 levels indicate T4 Thyrotoxicosis (problem is conversion of T4 to T3)
- 5.Normal T3 & T4 along with ↓ TSH indicate mild / Subclinical Hyperthyroidism

. **COMMENTS:** Assay results should be interpreted in context to the clinical condition and associated results of other investigations. Previous treatment with corticosteroid therapy may result in lower TSH levels while thyroid hormone levels are normal. Results are invalidated if the client has undergone a radionuclide scan within 7-14 days before the test.

. **Disclaimer:**TSH is an important marker for the diagnosis of thyroid dysfunction.Recent studies have shown that the TSH distribution progressively shifts to a higher concentration with age ,and it is debatable whether this is due to a real change with age or an increasing proportion of unrecognized thyroid disease in the elderly

. Reference ranges are from Teltz fundamental of clinical chemistry 8th ed (2018)
Test performed by Instrument : Beckman coulter Dxi 800

. **Note:** The result obtained relate only to the sample given/ received & tested. A single test result is not always indicative of a disease, it has to be correlated with clinical data for interpretation.

ULTRASOUND OF WHOLE ABDOMEN

Liver is of normal size (11.9 cm). Echo-texture is normal. No focal space occupying lesion is seen within liver parenchyma. Intrahepatic biliary channels are not dilated. Portal vein diameter is normal.

Gall bladder is well distended. Wall is not thickened. No calculus or mass lesion is seen in gall bladder. Common bile duct is not dilated.

Pancreas is of normal size and contour. Echo-pattern is normal. No focal lesion is seen within pancreas.

Spleen is of normal size and shape (10.4 cm). Echotexture is normal. No focal lesion is seen.

Kidneys are normally sited and are of normal size and shape. Cortico-medullary echoes are normal. Collecting system does not show any dilatation.

Right kidney is measuring approx. 9.6 x 4.1 cm.

Left kidney is measuring approx. 10.2 x 5.0 cm.

- A calculus of average size 4.8 mm is noted in lower pole calyx.

Urinary bladder is well distended and does not show any calculus or mass lesion.

Prostate is normal in size with normal echotexture and outline.

No enlarged nodes are visualized. No retro-peritoneal lesion is identified.

No significant free fluid is seen in pelvis.

IMPRESSION:

- Left renal calculus.
- Rest no significant abnormality is detected.
