ABDOMINAL SONOGRAPHY

Liver is of normal size, shape, has smooth margins & regular contours and the parenchyma is mildly hyperechoic in echostructure, **fatty changes (Grade I)**. No focal lesion.

Gall bladder is of normal size, shape, has thin walls & the contents are clear fluid. No evidence of any calculus. Biliary tree is undilated.

Pancreas is normal, no focal / diffuse pathology. Spleen is normal. The Portal and splenic veins are normal in calibre.

Both Kidneys are normal in size [measure about 11 cms. in length], shape and echostructure. No calculus in both. The collecting system and ureter on both side are undilated.

Urinary bladder is normal in size, shape and has thin walls.

Uterus is of **multiparous** size, is **bulky** [measures about 9 x 6 x 4 cms. in diam.] and is retroverted. The uterine outlines are smooth & regular and the myometrial & endometrial echopattern is normal. Uterine cavity is empty. No obvious mass lesion.

Both ovaries are mildly enlarged in size (around 9-10 cm³ in vol.) and there are multiple very small (2-5 mms.), cystic images in both with increased stromal tissue.

No adnexal / pelvic mass or cyst. No localised or free pelvic collection.

There is no ascitis. No obvious abdominal lymphadenopathy. No sub / supra diaphragmatic pathology on either side.

CONCLUSION :

Fatty changes in liver (Grade I).

Sonographic appearance of ovaries is in favour of Polycystic ovaries.

Further clinical and hormonal correlation is requested.

DR.D.S.CHHABRA.

TEST	RESULTS	UNIT	BIOLOGICAL REF RANGE	TEST REMARK
------	---------	------	----------------------	-------------

Thyroid Function Test				
Triiodothyronine (T3) CMIA	105.48	ng/dL	58 - 159	
Thyroxine (T4) CMIA	6.5	µg/dL	5.5 - 11.0	
TSH CMIA	1.4804	µIU/mL	0.4 - 4.2	

Interpretation Note:

Ultra sensitive-thyroid-stimulating hormone (TSH) is a highly effective screening assay for thyroid disorders. In patients with an intact pituitary-thyroid axis, s-TSH provides a physiologic indicator of the functional level of thyroid hormone activity. Increased s-TSH indicates inadequate thyroid hormone, and suppressed s-TSH indicates excess thyroid hormone. Transient s-TSH abnormalities may be found in seriously ill, hospitalized patients, so this is not the ideal setting to assess thyroid function. However, even in these patients, s-TSH works better than total thyroxine (an alternative screening test), when the s-TSH result is abnormal, appropriate follow-up tests T4 & free T3 levels should be performed. If TSH is between 5.0 to 10.0 & free T4 & free T3 level are normal then it is considered as subclinical hypothyroidism which should be followed up after 4 weeks & If TSH is > 10 & free T4 & free T3 level are normal then it is considered as overt hypothyroidism.

Serum triiodothyronine (T3) levels often are depressed in sick and hospitalized patients, caused in part by the biochemical shift to the production of reverse T3. Therefore, T3 generally is not a reliable predictor of hypothyroidism. However, in a small subset of hyperthyroid patients, hyperthyroidism may be caused by overproduction of T3 (T3 toxicosis). To help diagnose and monitor this subgroup, T3 is measured on all specimens with suppressed s-TSH and normal FT4 concentrations.

Normal ranges of TSH & thyroid hormones vary according trimester in pregnancy.
