Average risk	3.6	3.2
Moderate risk (2x average)	6.3	5.0
High risk (3x risk)	8	6.1

HDL levels have an inverse relationship with coronary heart disease. The ability of HDL to predict the development of coronary atherosclerosis has been estimated to be four times greater than LDL and eight times greater than TC. Treatment is recommended for those with a HDL level below 40 mg/dL. An HDL of 60 mg/dL is considered protection against heart disease.

Blood should be collected after a 12-hour fast (no food or drink, except water). For the most accurate results, wait at least 2 months after a heart attack, surgery, infection, injury or pregnancy to check Lipid Profile.
