Mixed fibroglandular pattern is noted in both breasts limiting optimal evaluation .

No evidence of any spiculated high density mass lesion / focal asymmetric density / retraction / clusters of microcalcification is seen.

No abnormal skin thickening is seen.

Evidence of soft tissue opacity lesion with benign calcification is noted in superior aspect of right breast.

Evidence of soft tissue opacity lesion with benign calcification is noted in inferior aspect of left breast.

Evidence of soft tissue opacity lesions are noted in superior aspect of left breast.

SONOMAMMOGRAPHY:

Evidence of wider than tall, hypoechoic lesion with calcification is noted in the right breast at 1'O clock position measuring 0.5 x 0.4 cm.

Evidence of wider than tall, hypoechoic lesion with calcification is noted in the left breast at 6/7'O clock position measuring 0.7 x 0.6 cm.

Evidence of two, wider than tall, hypoechoic lesion without calcification are noted in the left breast measuring 0.6 x 0.6 cm at 2/3'O clock position and 0.4 x 0.4 cm at 3/4'O clock position.

Note: Investigations have their limitations. Solitary radiological investigations never confirm the final diagnosis. They only help in diagnosing the disease in correlation to clinical symptoms and other related tests. Mammography is known to have inter-observer variations. Further / Follow-up imaging may be needed in some cases for confirmation / exclusion of diagnosis. Patient was explained in detail verbally about the Mammography findings and its limitations. In case of any typographical error in the report, patient is requested to immediately contact the centre for rectification. Please interpret accordingly.
