Clinical Significance:

Anti-müllerian hormone (AMH), also known as müllerian-inhibiting substance, is a dimeric glycoprotein hormone belonging to the transforming growth factor-beta family. It is produced by Sertoli cells of the testis in males and by ovarian granulosa cells in females. AMH is expressed in the follicles of female of reproductive age and inhibits the transition of follicles from primordial to primary stages. Because of the gender differences in AMH concentration, its changes in circulating concentrations with sexual development, and its specificity for Sertoli and granulosa cells, measurement of AMH has utility in the assessment of gender, gonadal function, fertility, and as a gonadal tumor marker. Since AMH is produced continuously in the granulosa cells of small follicles during the menstrual cycles, it is superior to the episodically released gonadotropins and ovarian steroids as a marker of ovarian reserve.
