T4 (Thyroxine) <small>Method:CLIA</small>	10.20	µg/dL	4.5 - 12.6

Sample Type: Serum			

Comments:
 Thyroid stimulating hormone (TSH) is synthesized and secreted by the anterior pituitary in response to a negative feedback mechanism involving concentrations of FT3 (free T3) and FT4 (free T4). Additionally, the hypothalamic tripeptide, thyrotropin-releasing hormone (TRH), directly stimulates TSH production. TSH stimulates thyroid cell production and hypertrophy, also stimulate the thyroid gland to synthesize and secrete T3 and T4. Quantification of TSH is significant to differentiate primary (thyroid) from secondary (pituitary) and tertiary (hypothalamus) hypothyroidism. In primary hypothyroidism, TSH levels are significantly elevated, while in secondary and tertiary hypothyroidism, TSH levels are low.

- TSH levels During Pregnancy :**
- First Trimester : 0.1 to 2.5 µIU/mL
 - Second Trimester : 0.2 to 3.0 µIU/mL
 - Third Trimester : 0.3 to 3.0 µIU/mL

Useful For

- Evaluating patients with documented prostate problems in whom multiple prostate-specific antigen tests may be necessary per year
- Monitoring patients with a history of prostate cancer as an early indicator of recurrence and response to treatment.
- Prostate cancer screening

Comments

-Prostate-specific antigen (PSA) is a glycoprotein that is produced by the prostate gland, the lining of the urethra, and the bulbourethral gland. Normally, very little PSA is secreted in the blood. Increases in glandular size and tissue damage caused by benign prostatic hyperplasia, prostatitis, or prostate cancer may increase circulating PSA levels.
 -Digital rectal examination generally does not increase normal prostate-specific antigen (PSA) values. However, cystoscopy, urethral instrumentation, and prostate biopsy may increase PSA levels.
