## Transabdominal sono screening scan – whole abdomen

Extensive bowel gases precluded optimal examination.

### Hepato-biliary system:

Liver is normal in size. Hepatic parenchymal echotexture is normal, homogenous and uniform. No focal lesion seen. Intrahepatic biliary radicles are not dilated. Portal vein and cbd are normal in caliber. Gall bladder is seen in normal distension. Walls are normal in thickness and are smooth. No mass is seen. Lumen is anechoic. Pancreas is normal in size and echotexture. Pancreatic duct is not dilated. No area of calcification is seen in pancreas.

### Uro-genital system:

Both the kidneys are normal in size. Parenchymal echotexture is normal. Corticomedullary differentiation is maintained. Central echo-complexes are normal. Urinary bladder is seen in full distension. Walls are smooth and normal in thickness. Lumen is anechoic. Prostate is normal in size measuring approx 41 x 31 x 31 mm vol 20 cm<sup>3</sup>. Prostatic echotexture is normal. Contours are normal. No obvious mass is seen.

### Spleen & retroperitonium:

Spleen is normal in size. Parenchymal echotexture is normal. **Most of the retroperitonium is not seen clearly, obscured by bowel gases.**

No ascites seen.

### Sonographic findings are suggestive of:-

- Normal: liver, gall bladder, pancreas, spleen, kidneys, u. Bladder, prostate.

This is only professional opinion based on imaging finding and not the diagnosis  
It should be correlated clinically, to arrive at proper conclusion.

Primary malfunction of the thyroid gland may result in excessive (hyper) or low (hypo) release of T3 or T4. In addition, as TSH directly affect thyroid function, malfunction of the pituitary or the hypothalamus influences the thyroid gland activity. Disease in any portion of the thyroid-pituitary-hypothalamus system may influence the level of T3 and T4 in the blood, in Primary hypothyroidism, TSH levels are significantly elevated, while in secondary and tertiary hypothyroidism, TSH levels may be low. In addition, in Euthyroid sick Syndrome, multiple alterations in serum thyroid function test findings have been recognized.

| < 6 | Non - Diabetic level |

**Clinical Information:**

Glycated hemoglobin testing is recommended for both (a) checking blood sugar control in people who might be pre-diabetic and (b) monitoring blood sugar control in patients with more elevated levels, termed diabetes mellitus. The American diabetes association guidelines suggest that the Glycosylated hemoglobin test be performed at least two times a year in patients with diabetes that are meeting treatment goals (and that have stable glycemic control) and quarterly in patients with diabetes whose therapy has changed or that are not meeting glycemic goals. Glycated hemoglobin measurement is not appropriate where there has been a change in diet or treatment within 6 weeks. Hence, people with recent blood loss, hemolytic anemia, or genetic differences in the hemoglobin molecule (hemoglobinopathy) such as sickle-cell disease and other conditions, as well as those that have donated blood recently are not suitable for this test.
