### Esr, Erythrocyte Sedimentation Rate

<b>Esr, Erythrocyte Sedimentation Rate (Westergren)</b>	<b>20</b>	0-10	mm/hr
---	-----------	------	-------

#### **Interpretation:**

- It indicates presence and intensity of an inflammatory process. It does not diagnose a specific disease. Changes in the ESR are more significant than the abnormal results of a single test.
- It is a prognostic test and used to monitor the course or response to treatment of diseases like tuberculosis, bacterial endocarditis, acute rheumatic fever, rheumatoid arthritis, SLE, Hodgkins disease, temporal arteritis and polymyalgia rheumatica.
- It is also increased in pregnancy, multiple myeloma, menstruation, and hypothyroidism.

### **Blood Group & Rh Type**

#### **Blood Grouping & Rh Typing**

Method : Forward and Reverse By Tube Method

"AB" POSITIVE (+VE)

#### **Methodology**

This is done by forward and reverse grouping by tube Agglutination method.

#### **Interpretation**

Newborn baby does not produce ABO antibodies until 3 to 6 months of age. So the blood group of the Newborn baby is done by ABO antigen grouping (forward grouping) only, antibody grouping (reverse grouping) is not required. Confirmation of the New-born's blood group is indicated when the A and B antigen expression and the isoagglutinins are fully developed (2-4 years).

Glyco Hb (HbA1C) Method : EDTA Whole blood,HPLC	6.1	Non-Diabetic: <=5.9 Pre Diabetic:6.0-6.4 Diabetic: >=6.5	%
Estimated Average Glucose :	128		mg/dL

**Interpretations**

- HbA1C has been endorsed by clinical groups and American Diabetes Association guidelines 2017 for diagnosing diabetes using a cut off point of 6.5%
- Low glycated haemoglobin in a non diabetic individual are often associated with systemic inflammatory diseases, chronic anaemia (especially severe iron deficiency and haemolytic), chronic renal failure and liver diseases. Clinical correlation suggested.

### **Comments:**

IF NOT ON DRUGS SUGGESTED FT3 & FT4 ESTIMATION

**Please correlate with clinical conditions.**

**Note :** Serum T3, T4 and TSH form the three components of thyroid screening panel, useful in diagnosing various disorders of the thyroid gland. Primary Hypothyroidism is accompanied by depressed serum T3 and T4 values and elevated serum TSH levels. Although elevated TSH levels are nearly always indicative of Primary Hypothyroidism, rarely they can from TSH secreting pituitary tumors (Secondary hyperthyroidism)To confirm diagnosis - evaluate FT3 and FT4.
