BIOCHEMISTRY

Test Name	Value	Unit	Normal Value
SERUM URIC ACID	4.63	mg/dL	2.4 - 5.7

Comments:

Uric acid is the metabolic end-product of purine metabolism. Increased levels of uric acid in serum (hyperuricemia) are either due to increased synthesis or decreased excretion in urine. This test is used for diagnosis and treatment of renal and metabolic disorders like renal failure, gout, leukemia, Psoriasis, starvation or patients on cytotoxic drugs. Uric acid levels are very labile and show seasonal / day to day variation. Its levels in serum are also increased in emotional stress, starvation and in obese. Hyperuricemia is associated with increased risk for coronary artery disease.

Elevated levels of uric acid seen in - renal failure, gout (up to 25 % of relatives of patients with gout) , asymptomatic hyperuricemia, myelolymphoproliferative disorders, disseminated neoplasms, cancer chemotherapy, hemolytic anemia, sickle cell anemia, resolving pneumonia, toxemia of pregnancy, psoriasis (one third cases) , metabolic acidosis, von gierks's lead poisoning, Lesch- Nyhan syndrome, maple syrup urine disease, down syndrome, polycystic kidney disease, hypoparathyroidism, primary hyperparathyroidism, hypothyroidism, sarcoidosis and drugs (e.g. diuretics , mitomycin C, Levodopa , phenytoin, barbiturates, ammonia, small doses of salicylates).

COMMENTS: Assay results should be interpreted in context to the clinical condition and associated results of other investigations. Previous treatment with corticosteroid therapy may result in lower TSH levels while thyroid hormone levels are normal. Results are invalidated if the client has undergone a radionuclide scan within 7-14 days before the test. Abnormal thyroid test findings often found in critically ill clients should be repeated after the critical nature of the condition is resolved. The production, circulation, and disintegration of thyroid hormones are altered throughout the stages of pregnancy

blood or all fluid approx 97% people develop detectable antibodies within 3-12 weeks (21-84 days) of infection immunoassay are rapid tests used for screening positive rapid tests need a follow up confirm and includes western blot test. Rapid test performed during window period may give and thus detect HIV at about 10 days after infection even before antibodies develop but these are not used as a screening test.

BIOCHEMISTRY

Test Name	Value	Unit	Normal Value
HbA1c			
HbA1c (ngsp)	5.20		Reference Range (HbA1c) :
High Pressure Liquid Chromatography			4.5 - 6.4 %
			Good control : 4.5 - 6.4 %
			Fair control : 6.5 - 7.4 %
			Poor control : Above - 7.5 %

COMMENTS: HbA1c is an indicator of glycemic control. HbA1c represents average glycemia over the past six to eight weeks. Glycation of hemoglobin occurs over the entire 120 day life span of the red blood cell, but with in this 120 days. Recent glycemia has the largest influence on the HbA1c value. Clinical studies suggest that a patient in stable control will have 50% of their HbA1c formed in the month before sampling, 25% in the month before that, and the remaining 25% in months two to four. Estimated Average Glucose mg/dl = (HbA1c x 35.6) - 77.3) Correlation between HbA1c and Mean Plasma Glucose (MPG) is not "perfect" but rather only this means that to predict or estimate average glucose from Hb-A1c or vice-versa is not "perfect" but gives a good working ballpark estimate. Afternoon and evening results correlate more closely to HbA1c than morning results, perhaps because morning fasting glucose levels vary much more than daytime glucose levels, which are easier to predict and control. As per IFCC recommendations 2007, HbA1c being reported as above maintaining traceability to both IFCC (mmol/mol) & NGSP (%) units.

Complaining of Routine checkup

The liver is normal in size, contour and echotexture. Intrahepatic bile ducts and CBD are not dilated. Hepatic portal veins and the IVC appear normal in cali ber.

Gall bladder is adequately distended with normal intraluminal fluid contents. No evidence of calculus / wall thickness noted.

Pancreas is of normal size and contour with normal echotexture.

Kidneys are of normal size, shape and echo pattern. No calculus, mass or hydronephrotic changes seen in either kidney. Corticomedullary differentiation is normal bilaterally. Bilateral PCS are normal. Bilateral ureters are not dilated.

Right Kidney measures 9.7x2.9cm

Left kidney measures 10.2x9.3cm

Spleen is of normal size and shape. Ecotexture is normal. No focal lesion is seen. No evidence of retro-peritoneal lymphadenopathy/ ascites/ pleural effusion noted.

Uterus is anteverted and is normal in size. Myometrium shows normal echo-pattern. No mass or lesion is noted.

Endometrial is normal and is in mid line.

Both ovaries are visualized and are normal with subcentemetric follicles. No free fluid is seen in the pouch of douglas.

Urinary bladder does not show any calculus or mass lesion.
