### HbA1C-Glycosylated Hemoglobin

Sample Type : WHOLE BLOOD EDTA

Glycosylated Hemoglobin- HbA1C HPLC	4.80	%	Non-diabetic 4-5.7 -Pre-diabetic 5.7-6.4 -Diabetic > 6.5
Estimated Average Glucose Calculated	91.06	mg/dl	

#### Comments:

- HbA1c is used for monitoring diabetic control.
- HbA1c has been endorsed by clinical groups & ADA(American Diabetes Association) guidelines
- Trend in HbA1c are a better indicator of diabetic control than a solitary test.
- Low glycosylated haemoglobin (below 4%) in a non-diabetic individual are often associated with systemic inflammatory diseases. Chronic anaemia (especially severe iron deficiency & haemolytic anaemia), chronic renal failure and liver diseases.. Clinical correlation suggested.
- Interference of haemoglobinopathies in HbA1c estimation:
- For HbF > 25%, an alternate platform (Fructosamine) is recommended for testing of HbA1c.
- Homozygous haemoglobinopath is detected, fructosamine is recommended for monitoring diabetic status
- Heterozygous state detected(D10/turbo is corrected for HbS and HbC trait).
- In known diabetic patients, following values can be considered as a tool for monitoring the glycaemic control. Excellent Control-6 to 7 %, Fair to Good Control -7 to 8 %, Unsatisfactory Control. 8 to 10 % and Poor Control – More than 10 %.

Note : Hemoglobin electrophoresis (HPLC method) is recommended for detecting haemoglobinopathy.

\* This result is true for the sample from this laboratory.

\* Remarks : Clinical correlation suggested

\* Test results may show interlaboratory variations.

### URINE FOR SUGAR - FASTING

Sample Type : Urine

Result	NIL		Nil
Benedicts test			

#### INTERPRETATION:

When the glucose level in blood exceeds the renal thresholds of glucose (160-180mg/dl) glucose starts to appear in urine. Glucose in urine gets excreted in diabetes mellitus. Elevated level of glucose in urine may also be a result of renal glucosuria. Other causes of glucose in urine are hyperthyroidism, high sugar diet, liver cirrhosis.
