**HAEMATOLOGY**

**GLYCOSYLATED HAEMOGLOBIN (HbA1c)**

GLYCOSYLATED HAEMOGLOBIN (HbA1c)	4.98	%	Non Diabetic : <6.00 Good Control : 6.00 - 7.00 Fair Control : 7.00 - 8.00 Poor Control : >8.00
----------------------------------	------	---	--

ESTIMATED AVERAGE GLUCOSE (eAG)	96.23	mg/dl	65.00 - 135.00
---------------------------------	-------	-------	----------------

**REMARKS :**

In vitro quantitative determination of **HbA1c** in whole blood is utilized in long term monitoring of glycemia. The HbA1c level correlates with the mean glucose concentration prevailing in the course of the patient's recent history (approx - 8-12 weeks) and therefore provides much more reliable information for glycemia monitoring than determination of blood glucose or urinary glucose. It is recommended that the determination of **HbA1c** be performed at intervals of 3-6 months during diabetes mellitus therapy. Results of **HbA1c** should be assessed in conjunction with the patient's medical history, clinical examinations and other findings.

**Estimated average glucose (eAG)** - There is a predictable relationship between HbA1c and eAG. It helps people with diabetes to correlate their A1c to daily glucose monitoring levels. It reflects the average glucose levels in the past 2-3 months. The eAG calculation converts the A1c percentage to the same units used by glucometers mg/dl. The following table shows the relationship of eAG and A1c.

HbA1c	eAG (mg/dl)
