MediWheel Full Body Health Checkup Male				
T3 - Total (Tri Iodothyronine) (ECLIA)	113.70		ng/dL	80.00 - 200.00
T4 - Total (Thyroxine - Total) (ECLIA)	5.98		µg/dL	5.1-14.1
TSH, Thyroid Stimulating Hormone (ECLIA)	1.23		µIU/mL	0.27-4.2
Test Observations:				
<p>The following potential sources of variation should be considered while interpreting thyroid hormone results: Circadian variation in TSH secretion: peak levels are seen between 2-4 am. Minimum levels seen between 6-10 am. This variation may be as much as 50% thus, influence of sampling time needs to be considered for clinical interpretation. Total T3 and T4 levels are seen to have physiological rise during pregnancy and in patients on steroid treatment Circulating forms of T3 and T4 are mostly reversibly bound with Thyroxine binding globulins (TBG), and to a lesser extent with albumin and Thyroid binding Pre-Albumin. Thus the conditions in which TBG and protein levels alter such as chronic liver disorders, pregnancy, excess of estrogens, androgens, anabolic steroids and glucocorticoids may cause misleading total T3, total T4 and TSH interpretations. TSH may be normal in the presence of hyperthyroidism under the following conditions: T3 thyrotoxicosis, Hypoproteinemia related reduced binding, in presence of drugs (eg Phenytoin, valiates etc) Infants and neonates have higher levels of T4 due to increased concentration of TBG T4 levels may be normal in central hypothyroidism, recent rapid correction of hypothyroidism or hyperthyroidism, pregnancy, phenytoin therapy etc. TSH values of <0.03 uIU/mL must be clinically correlated to evaluate the presence of a rare TSH variant in certain individuals which is undetected by conventional methods. Presence of Autoimmune disorders may lead to spurious results of thyroid hormones Spurious drugs can lead to interference in test results It is recommended to evaluate unbound fractions, that is free T3 (fT3) and free T4 (fT4) for clinic-pathologic correlation, as these are the metabolically active forms.</p>
