S. Cholesterol	224.6 (H)	mg/dL	125-200	CHOD-PAP
S. Triglycerides	165.6 (H)	mg/dL	50-165	GPO-TOPS

S.Cholesterol/HDLC Ratio	5.25		3.0-6.0	Calculated
LDLC/HDLC RATIO	3.47		2.5-3.5	Calculated

Interpretation :-

Note : - Blood normally contains more than one type of fat. The typical lipid panel measures two main types of blood fat, cholesterol and triglycerides. Their functions and the effect of high levels on your health can be quite different. While both contribute to premature cardiovascular disease, high levels of triglycerides have also been found to increase your chance of having a heart attack or stroke even when the LDL-Cholesterol is not elevated (see below). Triglycerides can also cause an acute medical condition called pancreatitis when triglycerides are extremely high.

3.4-7.0

Interpretation :-

A uric acid blood test, also known as a serum uric acid measurement, determines how much uric acid is present in your blood. The test can help determine how well your body produces and removes uric acid. Uric acid is a chemical produced when your body breaks down foods that contain organic compounds called purines. Foods and beverages with a high purine content include:
liver, anchovies, mackerel, dried beans, beer, wine
Purines are also created through the natural process of cell breakdown in the body. Most uric acid is dissolved in the blood, filtered through the kidneys, and expelled in the urine. Sometimes the body produces too much uric acid or doesn't filter out enough of it. Hyperuricemia is the name of the disorder that occurs when you have too much uric acid in your body.
