Methodology: HPLC  
Instrument Used: Bio-Rad D-10

**Comment**

- For patients with Hb variant diseases there may be lowering of HbA1c due to low HBA synthesis.
- EAG is value calculated from HbA1c & indicates average glucose level over past three months.

**Factors that interfere with HbA1c Measurement:** Genetic variants (e.g. Hbs trait, HbC trait), elevated fetal hemoglobin (HbF) and chemically modified derivatives of hemoglobin (e.g. carbamylated Hb in patients with renal failure) can affect the accuracy of HbA1c measurements. The effects vary depending on the specific Hb variant or derivative and the specific HbA1c method.

**Factors that affect interpretation of HbA1c Results:** Any condition that shortens erythrocyte survival or decreases mean erythrocyte age (e.g. recovery from acute blood loss, hemolytic anemia) will falsely lower HbA1c test results regardless of the assay method used.

Test Name	Value	Unit	Normal Range
PSA (Prostate-Specific Antigen) (Total)	0.36	ng/ml	<4.0ng/ml : Negative 4.0 - 10.0ng/ml : Borderline >10.0ng/ml : Elevated

Methodology: CLIA  
Instrument Used: BECKMAN COULTER (ACCESS-2)

**\*\*Interpretation:** PSA is a product of prostatic epithelium and is normally secreted in the semen. It has been widely used in the diagnosis and management of prostatic cancer. A universal cutoff value of 4ng/ml is generally being used. However this simplified approach has led to delayed diagnosis, as well as overdiagnosis in many cases. Several refinements in the interpretation of the PSA value have been proposed.

**Serum PSA density** Reflects the PSA produced per gram of the prostate tissue. It is calculated by dividing the total serum PSA by the estimated gland volume ( by transrectal ultrasound) . Upper normal value for PSA density is 0.15

Age specific reference ranges :	Age group	Upper reference range
	40-49Yrs	2.5 ng/ml
	50-59Yrs	3.5 ng/ml
	60-69Yrs	4.5 ng/ml
	70-79Yrs	6.5 ng/ml

**Serum PSA Velocity** Men with prostatic cancer demonstrate an increased rate of rise in PSA level as compared to men having other conditions. The rate of change that best distinguishes between men with and without prostatic cancer is 0.75ng/ml per year. For this to be valid at least three PSA measurements should be done over a period of 1.5 yrs to 2.0 years.

**Free PSA estimation** PSA exists in two forms, a major fraction bound to alpha1 chymotrypsin and a minor free fraction. The percentage of Free PSA (freePSA/totalPSAx100) is very useful in discriminating the conditions from prostate cancer when the total PSA level is in the "grey zone" of 4-10ng/ml. Depending on the freePSA % the probability of prostate cancer can be determined as follows

% free PSA	Probability of CA prostate
0-10%	55%
10-15%	28%
15-20%	25%
>20%	10%
