**Interpretation & Remarks:**

- HbA1c is used for monitoring diabetic control. It reflects the estimated average glucose.
- HbA1c has been endorsed by clinical groups & American Diabetes Association guidelines 2017, for diagnosis of diabetes using a cut-off point of 6.5%.
- Trends in HbA1c are a better indicator of diabetic control than a solitary test.
- Low HbA1c in a non-diabetic individual are often associated with systemic inflammatory diseases, chronic anemia (Specially severe iron deficiency anemia & haemolytic), chronic renal failure and liver diseases. Clinical correlation suggested.
- Interference of Hemoglobinopathies in HbA1c estimation:
  - A. For HbF > 2%, an alternate platform (Fructosamine) is recommended for testing of HbA1c.
  - B. Heterozygous hemoglobinopathy is detected, fructosamine is recommended for monitoring diabetic status.
  - C. Heterozygous state detected (D/D) (also is corrected for HbS and HbC trait).
- For known diabetic patients, following values can be considered as a bar for monitoring the glycaemic control.

Excellent Control - 6 - 7 %  
 Fair to Good Control - 7 - 8 %  
 Unsatisfactory Control - 8 - 10 %  
 Poor Control - > 10 %

Note: Hemoglobin electrophoresis (HPLC method) is recommended for detecting hemoglobinopathy.

Immunology

Test Name	Result	Unit	Reference Range
Thyroid Function Test			

THYROID FUNCTION TEST

Sample: Serum

Sample	Result	Unit	Reference Range
T3	0.36	ng/dl	0.80 - 1.80
T4	5.8	ug/dL	5.80 - 11.70
FT3	4.11	ug/dl	Adult Male - 0.27-5.5 Adult Female - 0.27-5.50 Newborns - <25 Up to 12 years - 0.5-5

TC358

1. The reference intervals for total thyroid hormone (T3) are 0.80 ng/dL for males and 0.80 ng/dL for females. The reference interval for total thyroxine (T4) is 5.80 ug/dL for males and 5.80 ug/dL for females. The reference interval for free triiodothyronine (FT3) is 0.27-5.5 ug/dL for males and 0.27-5.50 ug/dL for females. The reference interval for free thyroxine (FT4) is <25 ug/dL for newborns and 0.5-5 ug/dL for children up to 12 years of age.

2. The most common cause of thyroid dysfunction is autoimmune thyroid disease, which can manifest as either hypothyroidism or hyperthyroidism. The most common cause of hypothyroidism is Hashimoto's thyroiditis, an autoimmune disease in which the immune system attacks the thyroid gland, leading to decreased production of thyroid hormone. The most common cause of hyperthyroidism is Graves' disease, an autoimmune disease in which the immune system stimulates the thyroid gland to produce excess thyroid hormone.

3. The most common cause of thyroid dysfunction in children is autoimmune thyroid disease, which can manifest as either hypothyroidism or hyperthyroidism. The most common cause of hypothyroidism in children is Hashimoto's thyroiditis, an autoimmune disease in which the immune system attacks the thyroid gland, leading to decreased production of thyroid hormone. The most common cause of hyperthyroidism in children is Graves' disease, an autoimmune disease in which the immune system stimulates the thyroid gland to produce excess thyroid hormone.

4. The most common cause of thyroid dysfunction in newborns is congenital hypothyroidism, which is caused by a deficiency of thyroid hormone at birth. This condition is usually detected by newborn screening tests, which measure the level of thyroid hormone in the blood. If the level is low, the newborn is treated with thyroid hormone replacement therapy.

5. The most common cause of thyroid dysfunction in pregnant women is autoimmune thyroid disease, which can manifest as either hypothyroidism or hyperthyroidism. The most common cause of hypothyroidism in pregnant women is Hashimoto's thyroiditis, an autoimmune disease in which the immune system attacks the thyroid gland, leading to decreased production of thyroid hormone. The most common cause of hyperthyroidism in pregnant women is Graves' disease, an autoimmune disease in which the immune system stimulates the thyroid gland to produce excess thyroid hormone.
