| HbA1c (GLYCOSYLATED HEMOGLOBIN), BLOOD Method : (HPLC, NGSP certified) | 5.13 | | % |

Interpretation

| | |
|--|--|
| As per American Diabetes Association (ADA) | |
| Reference Group | HbA1c in % |
| Non diabetic adults >=18 years | <5.7 |
| At risk (Prediabetes) | 5.7 - 6.4 |
| Diagnosing Diabetes | >= 6.5 |
| Therapeutic goals for glycemic control | Age > 19 years Goal of therapy: < 7.0 Action suggested: > 8.0 Age < 19 years Goal of therapy: <7.5 |

Note:

1. Since HbA1c reflects long term fluctuations in the blood glucose concentration, a diabetic patient who is recently under good control may still have a high concentration of HbA1c. Converse is true for a diabetic previously under good control but now poorly controlled .
2. Target goals of < 7.0 % may be beneficial in patients with short duration of diabetes, long life expectancy and no significant cardiovascular disease. In patients with significant complications of diabetes, limited life expectancy or extensive co-morbid conditions, targeting a goal of < 7.0 % may not be appropriate.

Comments

HbA1c provides an index of average blood glucose levels over the past 8 - 12 weeks and is a much better indicator of long term glycemic control as compared to blood and urinary glucose determinations.

ADA criteria for correlation between HbA1c & Mean plasma glucose levels.

ESR, Erythrocyte Sedimentation Rate

ESR - Erythrocyte Sedimentation Rate 13 0 - 15 mm/hr

Method : EDTA Whole Blood, Manual Westergren

Interpretation:

- It indicates presence and intensity of an inflammatory process. It does not diagnose a specific disease. Changes in the ESR are more significant than the abnormal results of a single test.
- It is a prognostic test and used to monitor the course or response to treatment of diseases like tuberculosis, bacterial endocarditis, acute rheumatic fever, rheumatoid arthritis, SLE, Hodgkins disease, temporal arteritis and polymyalgia rheumatica.
- It is also increased in pregnancy, multiple myeloma, menstruation, and hypothyroidism.
