**BIOCHEMISTRY****HbA1C (HPLC Method)**

Glycated Haemoglobin (HbA1C), by HPLC	: 5.3	%	4.5 - 6.5
Estimated Average Glucose (eAG)	: 105.3	mg/dL	

**Interpretation :**

HbA1C level reflects the mean glucose concentration over previous 8-12 weeks and provides better indication of long term glycemic control.

**For diagnosis of Diabetes Mellitus (>= 18 yrs of age) :**

5.7 % - 6.4 % : Increased risk for developing diabetes.

>= 6.5 % : Diabetes

**Therapeutic goals for glycemic control :**

Adults : < 7%

Toddlers and Preschoolers : < 8.5% (but > 7.5 %)

School age (6-12 yrs) : < 8%

Adolescents and young adults (13 - 19 yrs) : < 7.5 %

The A1c target should be individualized based on numerous factors, such as age, life expectancy, comorbid conditions, duration of diabetes, risk of hypoglycemia or adverse consequences from hypoglycemia, patient motivation and adherence.

Levels of HbA1C may be low as result of shortened RBC life span in case of hemolytic anemia.

Increased HbA1C values may be found in patients with polycythemia or post splenectomy patients.

In patients with Homozygous forms of rare variant Hb(CC,SS,EE,SC), HbA1c cannot be quantitated as there is no HbA. In such circumstances glycemic control needs to be monitored using alternative methods like plasma glucose levels or serum Fructosamine.

**Estimated Average Glucose (eAG) :**

1. eAG is an estimated average of blood glucose level over previous 8-12 weeks.

2. HbA1C and eAG have a linear relationship.

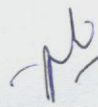

3. The eAG is not a substitute for fasting and post prandial blood sugar measurements as prescribed by your physician or home blood glucose monitoring.

Total Triiodothyronine (T3) Method ECLIA	81.94	ng/dl	Normal : 70-204 ng/dL First Trimester : 81-190 ng/dL Second Trimester : 100-260 ng/dL Third Trimester : 100-260 ng/dL

Thyroid Stimulating Hormone (TSH) Method ECLIA	4.81	uIU/ml	Normal : 0.27-4.2 µIU/ml First Trimester : 0.33-4.59 µIU/ml Second Trimester : 0.35-4.1 µIU/ml Third Trimester : 0.21-3.15 µIU/ml

REFERENCE : TIETZ Fundamentals of Clinical Chemistry

**INTERPRETATION :**

- Decreased values of T3 (T4 and TSH normal) have minimal clinical significance and not recommended for diagnosis of hypothyroidism.
- Total T3 and T4 values may also be altered in other conditions due to changes in serum proteins or binding sites Pregnancy, Drugs (Androgens, Estrogens, O C pills, Phenytoin), Nephrosis etc. In such cases Free T3 and Free T4 gives corrected values.
- Total T3 may decrease by <25 percent in healthy older individuals. - In cases of primary hypothyroidism, T3 and T4 levels are low and TSH is significantly elevated. In the case of pituitary dysfunction, either due to intrinsic hypothalamic or pituitary disease i.e central hypothyroidism, normal or marginally elevated basal TSH levels are often seen despite significant reduction in T4 and T3 levels.

- Primary hyperthyroidism (eg: Grave's disease, nodular goiter) is associated with high levels of thyroid hormones and depressed or undetectable levels of TSH.
