1. It indicates presence and intensity of an inflammatory process, never diagnostic of a specific disease. Changes are more significant than a single abnormal test.
2. It is a prognostic test and used to monitor the course or response to treatment of diseases like tuberculosis, bacterial endocarditis, acute rheumatic fever, rheumatoid arthritis, SLE, Hodgkins disease, temporal arteritis, polymyalgia rheumatica.
3. Also increased in pregnancy, multiple myeloma, menstruation & hypothyroidism

4. Low glycated haemoglobin (below 4%) in a non-diabetic individual are often associated with systemic inflammatory diseases, chronic anaemia (especially severe iron deficiency & haemolytic), chronic renal failure and liver diseases. Clinical correlation suggested.
5. To estimate the eAG from the HbA1C value, the following equation is used:  $eAG(mg/dl) = 28.7 * A1c - 46.7$
6. Interference of Haemoglobinopathies in HbA1c estimation.
  - A. For HbF > 25%, an alternate platform (Fructosamine) is recommended for testing of HbA1c.
  - B. Homozygous hemoglobinopathy is detected, fructosamine is recommended for monitoring diabetic status

### IMMUNO ASSAY

Investigation	Observed Value	Unit	Biological Reference Interval
PSA - TOTAL			
PSA-TOTAL	0.40	ng/ml	
Borderline : 4 - 10			

10 - 49 years: 1.5  
50 - 59 " : 2.5  
60 - 69 " : 4.5  
70 - 79 " : 7.5

1. PSA is detected in serum of males with normal, benign hypertrophic and malignant prostatitis.

2. Measurement of serum PSA level is not recommended as a screening procedure for the diagnosis of cancer, because elevated PSA levels also are observed in patients with benign prostatic hypertrophy.

3. The fact that PSA is unique to prostate tissue makes it a suitable marker for monitoring men with cancer of the prostate. PSA is also useful for determining possible recurrence after therapy when used in conjunction with other diagnostic indices.

METHOD: Fluorometric Immunoassay (Done with mini VIDAS Bio Merieux France)
