Blood Group & RH Factor

SPECIMEN	WHOLE BLOOD
ABO GROUP	'O'
RH FACTOR	POSITIVE
INTERPRETATION	

The ABO system consists of A, B, AB, and O blood types. People with type AB blood are called universal recipients, because they can receive any of the ABO types. People with type O blood are called universal donors, because their blood can be given to people with any of the ABO types.

Mismatches with the ABO and Rh blood types are responsible for the most serious, sometimes life-threatening, transfusion reactions. But these types of reactions are rare.

Rh system

The Rh system classifies blood as Rh-positive or Rh-negative, based on the presence or absence of Rh antibodies in the blood. People with Rh-positive blood can receive Rh-negative blood, but people with Rh-negative blood will have a transfusion reaction if they receive Rh-positive blood. Transfusion reactions caused by mismatched Rh blood types can be serious.

Dr. Hrisikesh Chevle

Mrs. MADHURI SAWANT		www.apexgroupofhospitals.com		Lab ID	40330195207
DOB :		Collected : 09-03-2024 16:55		Sample Quality	Adequate
Age : 47 Years		Reported : 09-03-2024 21:25		Location	MUMBAI
Gender : Female		Status : Final		Ref By	APEX HOSPITAL
CRM :				Client	SANIY PANDEY - MU058

Parameter	Result	Unit	Biological Ref. Interval
-----------	--------	------	--------------------------

THYROID FUNCTION TEST

Tri Iodo Thyronine (T3 Total), Serum CLIA	1.36	ng/mL	Non Pregnant: 0.7 - 2.04 Pregnancy: ² 1st trimester: 0.81-1.9 2nd & 3rd trimester: 1.0-2.60
---	------	-------	---

Clinical significance:-
Triiodothyronine (T3) values above 3.07 ng/mL in adults or over age related cutoffs in children are consistent with hyperthyroidism or increased thyroid hormone-binding proteins. Abnormal levels (high or low) of thyroid hormone-binding proteins (primarily albumin and thyroid-binding globulin) may cause abnormal T3 concentrations in euthyroid patients. Please note that Triiodothyronine (T3) is not a reliable marker for hypothyroidism. Therapy with amiodarone can lead to depressed T3 values.

Thyroxine (T4), Serum CLIA	9.05	µg/dL	5.5-11.0
--------------------------------------	------	-------	----------

Clinical significance:-
Thyroxine (T4) is synthesized in the thyroid gland. High T4 are seen in hyperthyroidism and in patients with acute thyroiditis. Low T4 are seen in hypothyroidism, myxedema, cretinism, chronic thyroiditis, and occasionally, subacute thyroiditis. Increased total thyroxine (T4) is seen in pregnancy and patients who are on estrogen medication. These patients have increased total T4 levels due to increased thyroxine-binding globulin (TBG) levels. Decreased total T4 is seen in patients on treatment with anabolic steroids or nephrosis (decreased TBG levels).

Thyroid Stimulating Hormone (TSH), Serum CLIA	H 9.517	µIU/mL	Nonpregnant: 0.4 - 5.5 Pregnancy: First Trimester: 0.3-4.5 Second Trimester: 0.5-4.6 Third trimester: 0.8-5.2
---	---------	--------	---

Clinical significance:
In primary hypothyroidism, TSH (thyroid-stimulating hormone) levels will be elevated. In primary hyperthyroidism, TSH levels will be low. TSH estimation is especially useful in the differential diagnosis of primary (thyroid) from secondary (pituitary) and tertiary (hypothalamus) hypothyroidism. In primary hypothyroidism, TSH levels are significantly elevated, while in secondary and tertiary hypothyroidism, TSH levels are low or normal. Elevated or low TSH in the context of normal free thyroxine is often referred to as subclinical hypo- or hyperthyroidism, respectively.

Pregnancy	American Thyroid Association	American European Endocrine	Thyroid society Association
1st trimester	< 2.5	< 2.5	< 2.5
2nd trimester	< 3.0	< 3.0	< 3.0
3rd trimester	< 3.5	< 3.0	< 3.0

Remarks: Kindly correlate clinically
