HAEMATOLOGY

Health checkup 2 Female

Glycosylated Hemoglobin (HbA1c) 5.7 % Non Diabetic adults <5.7
Prediabetic (at risk) 5.7-6.4
Diabetes >6.4

Estimated average blood glucose (eag) 117
Reference range (mg/dl):

90 - 120:Excellent control, 121 - 150:Good Control, 151 - 180:Average Control, 181 - 210:Action Suggested
>211:Panic value

REMARKS:-

In vitro quantitative determination of **HbA1C** in whole blood is utilized in long term monitoring of glycemia. The **HbA1C** level correlates with the mean glucose concentration prevailing in the course of the patient's recent history (approx - 6-8 weeks) and therefore provides much more reliable information for glycemia monitoring than do determinations of blood glucose or urinary glucose. It is recommended that the determination of **HbA1C** be performed at intervals of 4-6 weeks during Diabetes Mellitus therapy. On testing of HbA1C by HPLC method the result shows high variant window (93.8%) & no value of HbA1C. Therefore for accurate assay of glycaemic Control Fructosamine assay & for variant analysis Hb electrophoresis should be done.

Assay done by : Bio-Rad : D-10 (HPLC)

BLOOD GROUP (ABO) A
Rh typing POSITIVE

NOTE :

- * Apart from major A,B,H antigens which are used for ABO grouping and Rh typing, many minor blood group antigens exist. Agglutination may also vary according to titre of antigen and antibody.
- * So before transfusion, reconfirmation of blood group as well as cross-matching is needed.
- * Presence of maternal antibodies in newborns, may interfere with blood grouping.
- * Auto agglutination (due to cold antibody, falciparum malaria, sepsis, internal malignancy etc.) may also cause erroneous result.
