Comment

- For patients with Hb variant diseases there may be lowering of HbA1c due to low HBA synthesis.
- EAG is value calculated from HbA1c & indicates average glucose level over past three months.

Factors that interfere with HbA1c Measurement: Genetic variants (e.g. Hbs trait, HbC trait), elevated fetal hemoglobin (HbF) and chemically modified derivatives of hemoglobin (e.g. carbamylated Hb in patients with renal failure) can affect the accuracy of HbA1c measurements. The effects vary depending on the specific Hb variant or derivative and the specific HbA1c method.

Factors that affect interpretation of HbA1c Results: Any condition that shortens erythrocyte survival or decreases mean erythrocyte age (e.g. recovery from acute blood loss, hemolytic anemia) will falsely lower HbA1c test results regardless of the assay method used.

Comment: Note :>1. TSH levels are subject to circadian variation, reaching peak levels between 2 - 4.a.m. and at a minimum between 6-10 pm . The variation is of the order of 50% . hence time of the day has influence on the measured serum TSH concentrations
> 2. Values <0.03 μIU/mL need to be clinically correlated due to presence of a rare TSH variant in some individuals. *
Clinical Use:> Primary Hypothyroidism > Hyperthyroidism > Hypothalamic – Pituitary hypothyroidism
> Inappropriate TSH secretion > Nonthyroidal illness > Autoimmune thyroid disease
>Pregnancy associated thyroid disorders > Thyroid dysfunction in infancy and early childhood.
