BIOCHEMISTRY**HbA1C (HPLC Method)**

Glycated Haemoglobin (HbA1C), by HPLC	: 5.6	%	4.5 - 6.5
Estimated Average Glucose (eAG)	: 113.1	mg/dL	

Interpretation :

HbA1C level reflects the mean glucose concentration over previous 8-12 weeks and provides better indication of long term glyceemic control.

For diagnosis of Diabetes Mellitus (>= 18 yrs of age) :

5.7 % - 6.4 % : Increased risk for developing diabetes.
 >= 6.5 % : Diabetes

Therapeutic goals for glyceemic control :

Adults : < 7%

Toddlers and Preschoolers : < 8.5% (but > 7.5 %)

School age (6-12 yrs) : < 8%

Adolescents and young adults (13 - 19 yrs) : < 7.5 %

The A1c target should be individualized based on numerous factors, such as age, life expectancy, comorbid conditions, duration of diabetes, risk of hypoglycemia or adverse consequences from hypoglycemia, patient motivation and adherence.

Levels of HbA1C may be low as result of shortened RBC life span in case of hemolytic anemia.

Increased HbA1C values may be found in patients with polycythemia or post splenectomy patients.

In patients with Homozygous forms of rare variant Hb(CC,SS,EE,SC), HbA1c cannot be quantitated as there is no HbA. In such circumstances glyceemic control needs to be monitored using alternative methods like plasma glucose levels or serum Fructosamine.

Estimated Average Glucose (eAG) :

1. eAG is an estimated average of blood glucose level over previous 8-12 weeks.

2. HbA1C and eAG have a linear relationship.

3. The eAG is not a substitute for fasting and post prandial blood sugar measurements as prescribed by your physician or home blood glucose monitoring.
