| Glycosylated Hemoglobin (HbA1c): | 5.5 | % | < 6.0% : Non Diabetic 6.0 - 7.0% : Good Control 7.0 - 8.0% : Average Control 8.0 - 9.0% : Poor Control >9.0% :Very poor control |

Mean Blood Glucose **111.2** mg/dL

INTERPRETATION: HbA1c is an indicator of glycemic control.HbA1c represents average glycemia over the past six to eight weeks.Glycation of hemoglobin occurs over the entire 120 day life span of the red blood cell, but with in this 120 days. Recent glycemia has the largest influence on the HbA1c value. Clinical studies suggest that a patient in stable control will have 50% of their HbA1c formed in the month before sampling, 25% in the month before that, and the remaining 25% in months two to four.

Mean Plasma Glucose mg/dl = (HbA1c x 28.7) - 46.7) Correlation between HbA1c and Mean Plasma Glucose (MPG) is not "perfect" but rather only this means that to predict or estimate average glucose from Hb-A1c or vice-versa is not "perfect" but gives a good working ballpark estimate. Afternoon and evening results correlate more closely to HbA1c than morning results, perhaps because morning fasting glucose levels vary much more than daytime glucose levels, which are easier to predict and control.

As per IFCC recommendations 2007, HbA1c being reported as above maintaining traceability to both IFCC (mmol/mol) & NGSP (%) units..

| Total Prostatic Specific Antigen (PSA) | 1.68 | ng/mL | 0.0 - 4.0 |

Total Prostatic Specific Antigen (tPSA): PSA is elevated in benign prostatic hyperplasia (BPH). Clinically an elevated PSA value alone is not of diagnostic value as a specific test for cancer and should only be used in conjunction with other clinical manifestations and diagnostic procedures such as prostate biopsy and DRE (Digital Rectal Examination) report. Free PSA determinations may be helpful in regard to the differential diagnosis of BPH and prostate cancer conditions.
