USG FOR ABDOMEN

LIVER:

The echogenicity of the liver is normal.

There is no focal liver lesion.

There are no dilated intrahepatic biliary radicles.

GALL BLADDER:

Appears to be distended and shows no calculus or polyp in the lumen.

Wall thickness is normal.

SPLEEN:

The echogenicity of the spleen is normal.

There is no focal splenic lesion.

PANCREAS:

The echogenicity appears to be normal.

There is no free fluid in the abdomen.

There are no enlarged retroperitoneal lymphnodes.

KIDNEY:

The kidneys are normal in position, size, shape and outline.

The parenchyma is normal. Right kidney measure 96*42 cm.

Left kidney measure 85*39 cm.

BLADDER:

Bladder is well distended and shows normal wall thickness. No evidence of intra-

luminal mass or calculi.

PROSTATE:

Prostate gland is normal in size. It has smooth outline reflectivity.

There is no evidence of ascites.

No evidence of any gross bowel mass seen.

No evidence of any aorto-caval or mesenteric root lymphadenopathy.

HBA1C

Investigation	Observed Value	Biological Reference Interval	Unit
Glycosylated Hemoglobin(GHb/HbA1c)	5.29	4.0 - 6.0	mg/dL
Mean Blood Glucose	105.12	90 - 210 90-120 Excellent Control 121-150 Good Control 151-180 Average Control 181-210 Action Suggested >210 Panic Value	mg/dL

Comment

- 1. HbA1c is an indicator of glycemic control. HbA1c represents average Glycemia over the past six to eight weeks. Glycation of Hemoglobin occurs over the entire 120 day life span of the Red Blood Cell, but within this 120 days. Clinical studies suggest that a patient in stable control will have 50% of their HbA1c formed in the month before sampling, 25% in the month before that, and the remaining 25% in months two to four.
- 2. Mean Plasma Glucose mg/dL = 28.7 x A1C 46.7. Correlation between HbA1c and Mean Plasma Glucose (MPG) is not "perfect" but rather only this means that to predict or estimate average glucose from HbA1c or vice-versa is not "perfect" but gives a good working ballpark estimate.

3. Afternoon and evening results correlate more closely to HbA1c than morning results, perhaps because morning fasting glucose levels vary much more than daytime Glucose levels, which are easier to predict and control. As per IFCC recommendations 2007, HbA1c being reported as above maintaining traceability to both IFCC (mmol/mol) & NGSP (%) units.

Clinical Information:

Liver function tests, also known as liver chemistries, help determine the health of your liver by measuring the levels of proteins, liver enzymes, and bilirubin in your blood. Having abnormal results on any of these liver tests typically requires follow up to determine the cause of the abnormalities. Even mildly elevated results can be associated with liver disease. However, these enzymes can also be found in other places besides the liver.

Talk to your doctor about the results of your liver function test and what they may mean for you.
