Interpretation:		
<ul style="list-style-type: none">It indicates presence and intensity of an inflammatory process. It does not diagnose a specific disease. Changes in the ESR are more significant than the abnormal results of a single test.It is a prognostic test and used to monitor the course or response to treatment of diseases like tuberculosis, bacterial endocarditis, acute rheumatic fever, rheumatoid arthritis, SLE, Hodgkins disease, temporal arteritis and polymyalgia rheumatica.It is also increased in pregnancy, multiple myeloma, menstruation, and hypothyroidism.

GLYCOSYLATED HAEMOGLOBIN (GHB / HBA1c)

HbA1c (GLYCOSYLATED HEMOGLOBIN), BLOOD	5.5	%
---	-----	---

Method : (HPLC, NGSP certified)

Estimated Average Glucose :	111.15	-	mg/dL
-----------------------------	--------	---	-------

Interpretation

As per American Diabetes Association (ADA)	
Reference Group	HbA1c in %
Non diabetic adults >=18 years	<5.7
At risk (Prediabetes)	5.7 - 6.4
Diagnosing Diabetes	>= 6.5
Therapeutic goals for glycemic control	Age > 19 years Goal of therapy: < 7.0 Action suggested: > 8.0 Age < 19 years Goal of therapy: <7.5

Note:

1. Since HbA1c reflects long term fluctuations in the blood glucose concentration, a diabetic patient who is recently under good control may still have a high concentration of HbA1c. Converse is true for a diabetic previously under good control but now poorly controlled .
2. Target goals of < 7.0 % may be beneficial in patients with short duration of diabetes, long life expectancy and no significant cardiovascular disease. In patients with significant complications of diabetes, limited life expectancy or extensive co-morbid conditions, targeting a goal of < 7.0 % may not be appropriate.

Comments

HbA1c provides an index of average blood glucose levels over the past 8 - 12 weeks and is a much better indicator of long term glycemic control as compared to blood and urinary glucose determinations.

ADA criteria for correlation between HbA1c & Mean plasma glucose levels.

HbA1c(%)	Mean Plasma Glucose (mg/dL)
6	126
7	154
8	183

Test Description	Value(s)	Reference Range
Gamma Glutamyl Transferase (GGTP)		
Gamma GT Method : G-Glutamyl-Carboxy-Nitoanilide	40	<55 U/L

Interpretation

A high GGT level can help rule out bone disease as the cause of an increased ALP level, but if GGT is low or normal, then an increased ALP is more likely due to bone disease. Even small amounts of alcohol within 24 hours of a GGT test may cause a temporary increase in the GGT.

THYROID FUNCTION TEST (TFT)			
T3-Total	1.02	0.6 - 1.80	ng/mL
T4-Total	6.06	4.5 to 10.9	microgm/dl
TSH-Ultrasensitive	3.21	0.35 to 5.55	microU/mL

Method : CLIA

Interpretation

TSH levels may be affected by acute illness and drugs like doapamine and gluco corticoids .

Low or undetectable TSH is suggestive of Grave~s disease

TSH between 5.5 to 15.0 with normal T3 T4 indicates impaired thyrod hormone or subclinical hypothyroidism or normal T3 T4 with slightly low TSH suggests subclinical Hyperthyroidism.

TSH suppression does not reflect severity of hyperthyroidism therefore , measurement of FT3 & FT4 is important.

FreeT3 is first hormone to increase in early Hyperthyroidism.

Only TSH level can prove to be misleading in patients on treatment. Therefore FreeT3 , FreeT4 along with TSH should be checked.

During pregnancy, T3 T4 can be high and TSH can be slightly low
