Please correlate clinically.

(Note: Sonography has its limitations and the result should be correlated with clinical and other relevant patient data. Sonography is limited in determining CT scans).
(The accuracy and specificity of ultrasound for detection of small renal stones is low. IUT/URS may be considered for better evaluation. If clinically indicated).
(Small stones or crystals below may not be seen on transabdominal scan. If there is any renal history please ask for a more optimal ultrasound after consulting your doctor's advice regarding possibility and availability of IUT).

REMARKS In vitro quantitative determination of HbA1c in whole blood is utilized in long term monitoring of glycemia. The HbA1c level correlates with the mean glucose concentration prevailing in the course of the patient's recent history (approx - 6-8 weeks) and therefore provides much more reliable information for glycemia monitoring than do determinations of blood glucose or urinary glucose. It is recommended that the determination of HbA1c be performed at intervals of 4-6 weeks during Diabetes Mellitus therapy. Results of HbA1c should be assessed in conjunction with the patient's medical history, clinical examinations and other findings.
