BILATERAL MAMMOGRAPHY

Dedicated digital mammography with cranio caudal and medio lateral oblique view was performed.

The mammary parenchyma appears inhomogenously dense in retroareolar and lateral aspect of breast- because of prominent fibroglandular tissue. This some what lowers the sensitivity of mammography. No clustered microcalcification seen, although the dense surrounding tissue obscured the lesion.

No definite evidence of architectural distortion is seen.

No skin thickening or nipple retraction seen on either side.

COMMENTS:-

Mammographically inhomogenously dense parenchyma- because of prominent fibroglandular tissue. No secondary mammographic signs of malignancy (BIRADS I)

BIRADS Categories:

- 0 need imaging evaluation
- I negative
- II benign finding
- III probably benign findings
- IV suspicious abnormality
- V highly suggestive of malignancy
- VI biopsy proven malignancy

The false negative of mammography is approximately 10%. Management of palpable abnormality must be based upon clinical grounds.
