**IMMUNOLOGY**

Test Name	Result	Unit	Biological Ref. Interval
<b>THYROID FUNCTION TEST</b>			
<b>T3 (Triiodothyronine)</b> <small>CHEMILUMINESCENT MICROPARTICLE IMMUNOASSAY</small>	1.33	ng/mL	0.6 - 1.81
<b>T4 (Thyroxine)</b> <small>CHEMILUMINESCENT MICROPARTICLE IMMUNOASSAY</small>	10.2	µg/dL	4.5 - 12
<b>TSH</b> <small>CHEMILUMINESCENT MICROPARTICLE IMMUNOASSAY</small>	2.67	mIU/L	0.4 - 4.2

Thyroid stimulating hormone (TSH) is synthesized and secreted by the anterior pituitary in response to a negative feedback mechanism involving concentrations of FT3 (free T3) and FT4 (free T4). Additionally, the hypothalamic tripeptide, thyrotropin-releasing hormone (TRH), directly stimulates TSH production. TSH stimulates thyroid cell production and hypertrophy, also stimulate the thyroid gland to synthesize and secrete T3 and T4. Quantification of TSH is significant to differentiate primary (thyroid) from secondary (pituitary) and tertiary (hypothalamus) hypothyroidism. In primary hypothyroidism, TSH levels are significantly elevated, while in secondary and tertiary hypothyroidism, TSH levels are low. TSH test is done by Third generation TSH (TSH-Ultra) assays. Third generation TSH assays are defined by the functional sensitivity. It has far superior precision in the subnormal TSH range compared to second and first generation assays.

For routine urine analysis, 15 ml of midstream clean catch urine sample collected in wide mouth open container with tight fitting lid is desirable. Delayed transport, temperature and humidity can deteriorate urine sample quality. Urine routine microscopic examination is a primary investigation for suspected renal disease, urinary tract infection, detection of metabolic disorders such as diabetes mellitus, differential diagnosis of jaundice, and plasma cell dyscrasia. Urine Glucose and albumin measurement at regular interval are essential for analysing the progression of diabetic nephropathy from reversible to irreversible stage.
